1. Identify group migrate during carbocation rearrangement in following compound and give major product with nucleophile?

(A) Me

(B) Et

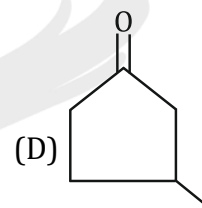

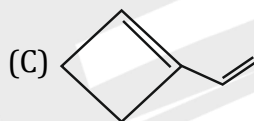

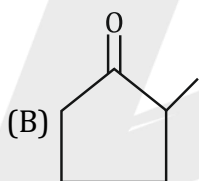

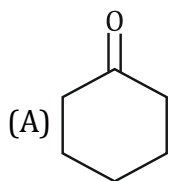

(C) H

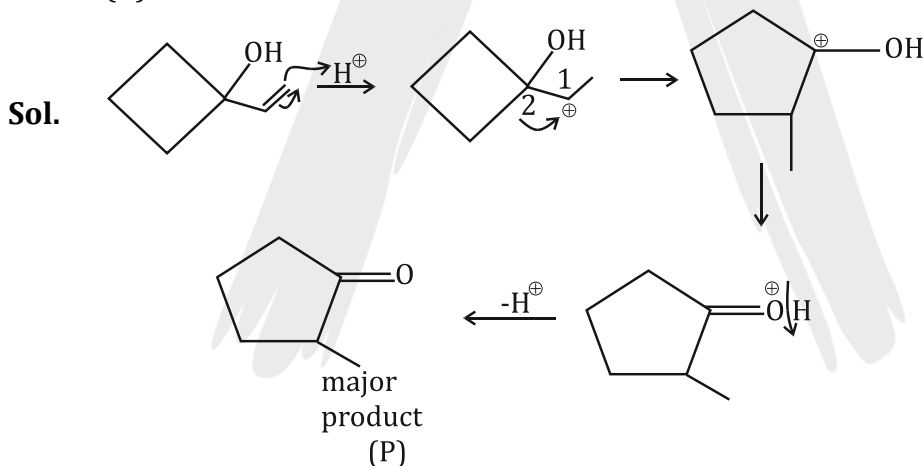

Ans. (A)

2. $\xrightarrow[\text{H}_2\text{SO}_4]{\text{conc.}}$ major product (P)

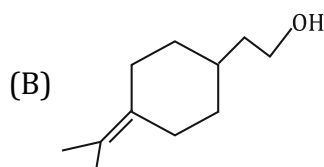

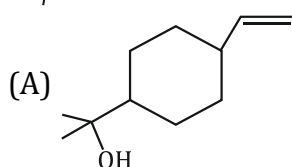

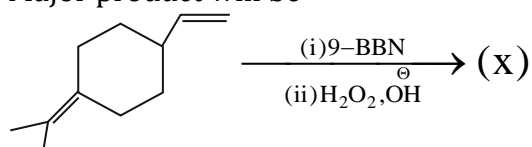

In the given Reaction major product (P) will be :-

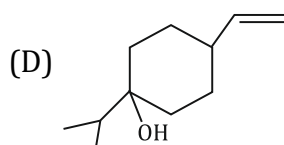

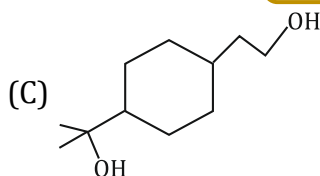

Ans. (B)

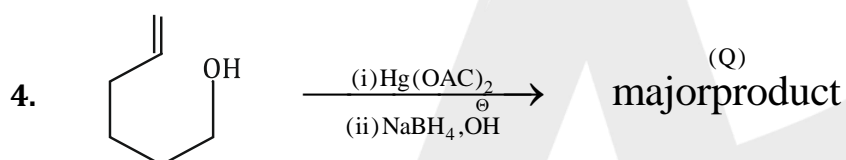

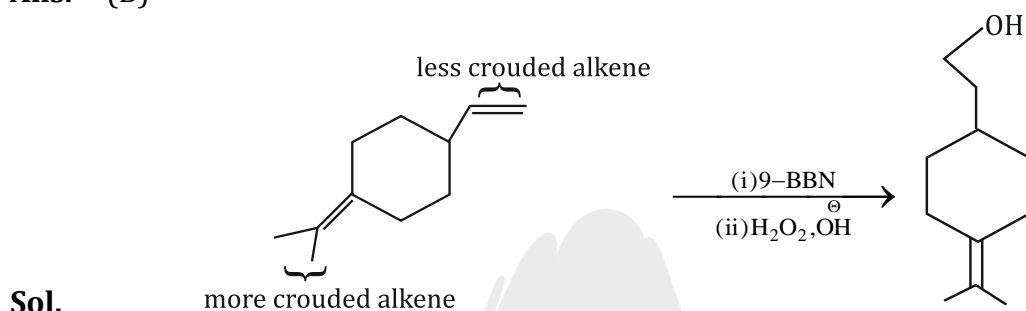

3. Major product will be

Link to View Video Solution: [Click Here](#)

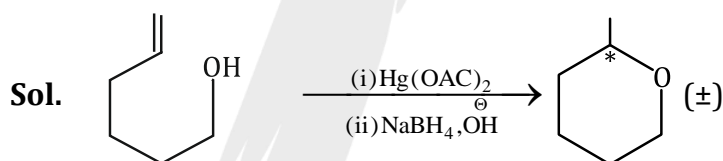

Ans. (B)

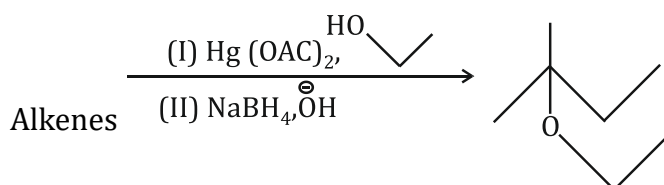

Which of the following statement is/are correct

- (A) (Q) have cyclic ether.
- (B) (Q) is optically inactive compound.
- (C) (Q) have one meso isomer.
- (D) (Q) have two isomers which are optically active.

Ans. (A),(D)

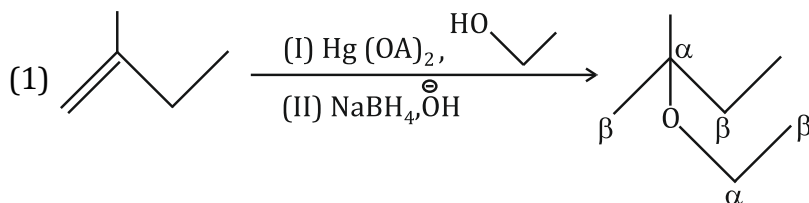

5. Total number of possible alkenes for the given reaction.

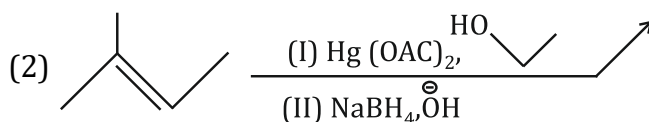

Ans. (2)

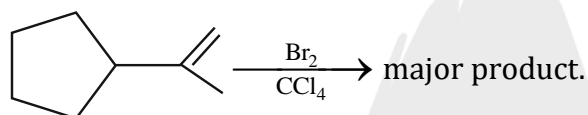

Link to View Video Solution: [Click Here](#)

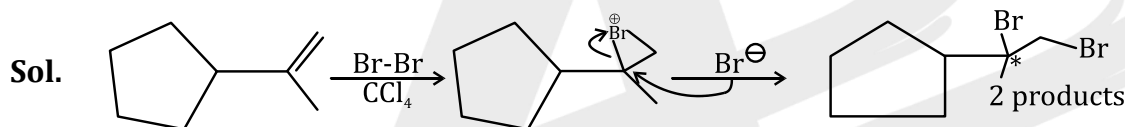

Sol.

6. In the given reaction total number of (non-classical carbocation) NCC is equal to (P) and total number of product is (Q), then find value of (P) + (Q) with be

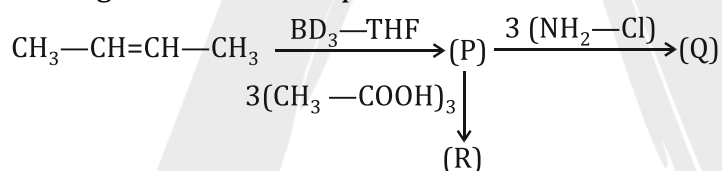

Ans. (4)

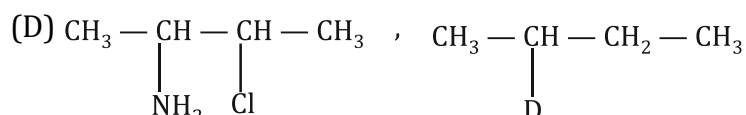

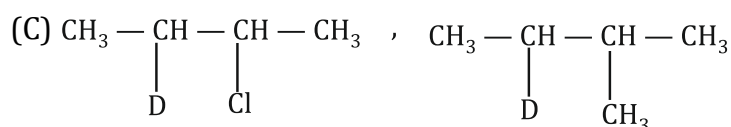

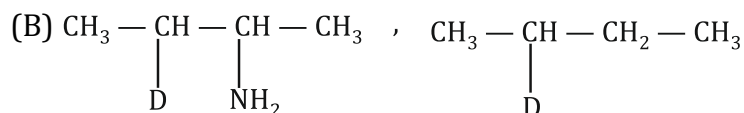

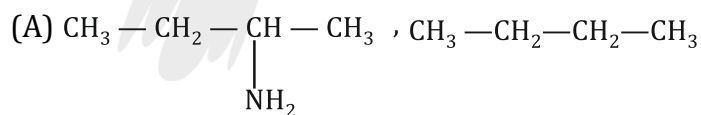

So, (P) = 2 NCC (2NCC)

(Q) = 2 product $\rightarrow P + Q = 2 + 2 = (4)$

7. In the given Reaction sequences

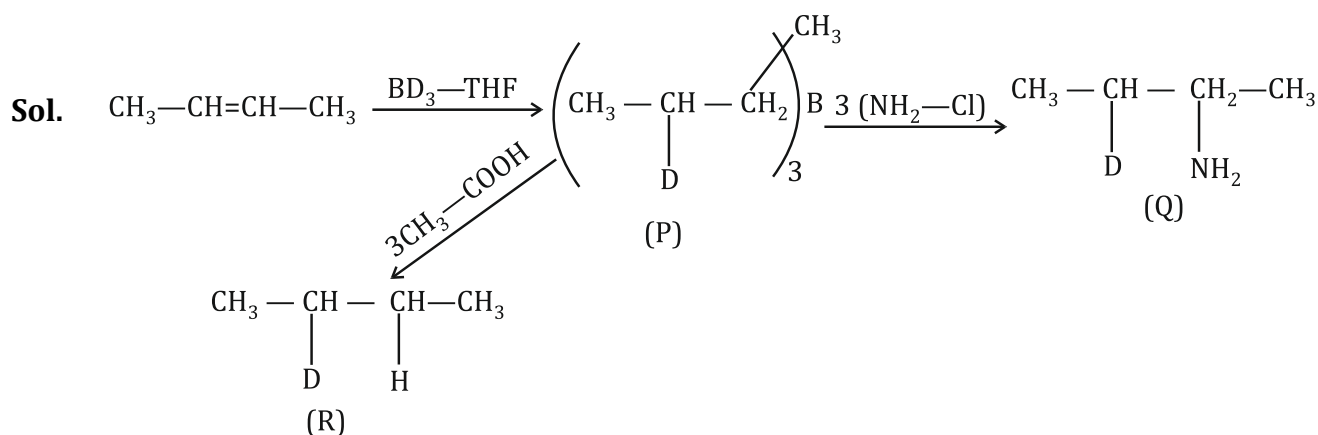

(Q) and (R), respectively are

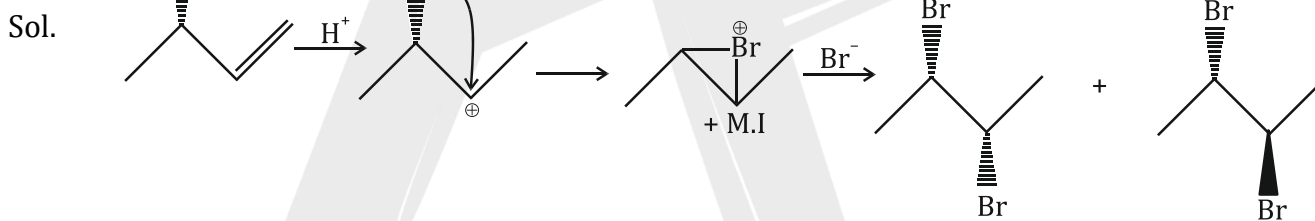

Ans. (B)

8. Total number of possible products are formed in the given reaction is

Ans. (2)

(Total number of Possible Product are Cis and Trans)
