

Relation b/w Conservative force and potential Energy

$$-W_{\text{system}} = dU$$

$$-F \cdot dx = dU$$

$$F = -\frac{dU}{dx}$$

(Conservative force)

QA

$$U = (x^2 - 2x + 1)$$

a) Find F at $x = 2$

$$F = -\frac{dU}{dx} = -[2x - 2]$$

$$F = -\underline{2(x-1)}$$

$$\text{At } x = 2$$

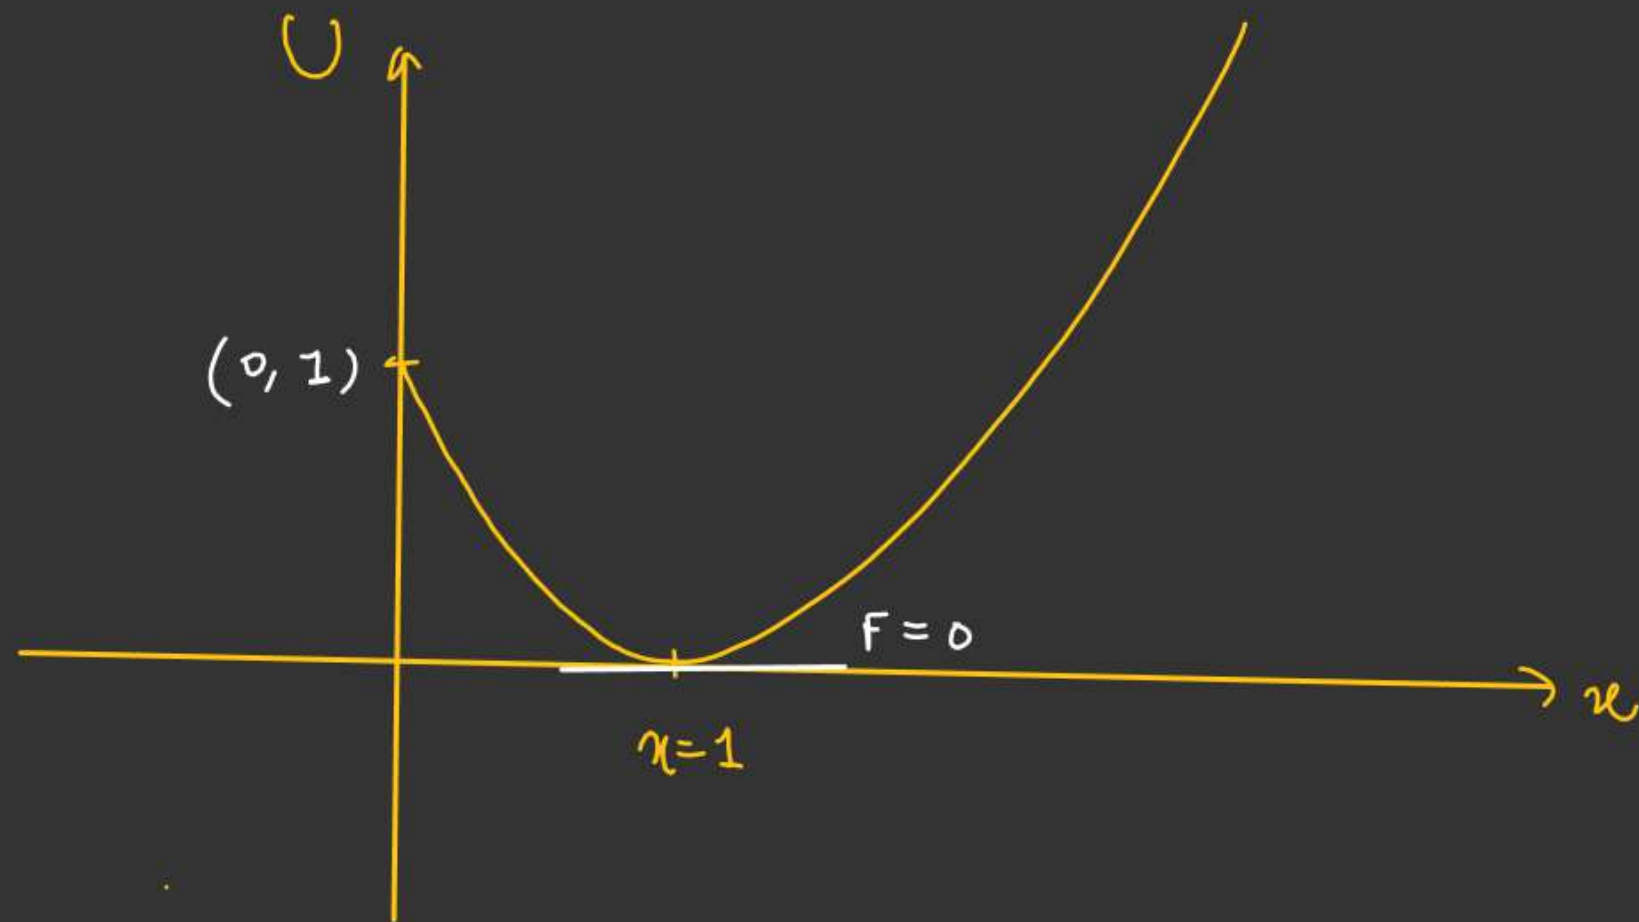

$$F = -2(2-1) = -2 \text{ N}$$

b) Find Equilibrium point

$$\text{For } \frac{dU}{dx} = 0 \text{ i.e. } F = 0$$

$$(x-1) = 0$$

$$\underline{x = 1}$$

QA

$$U = f(x, y, z)$$

$$F = - \left[\frac{\partial U}{\partial x} \hat{i} + \frac{\partial U}{\partial y} \hat{j} + \frac{\partial U}{\partial z} \hat{k} \right]$$

$$\frac{\partial U}{\partial x} \Rightarrow y \text{ \& } z \text{ assumed to be Constant.}$$

$$\frac{\partial U}{\partial y} \Rightarrow \text{Assuming } x \text{ \& } z \text{ as Constant}$$

$$\frac{\partial U}{\partial z} \Rightarrow \text{Assuming } x \text{ \& } y \text{ as Constant.}$$

$$U = (x^2 y + yz)$$

Find conservative force for this potential energy.

$$\begin{aligned} \frac{\partial U}{\partial x} &= \frac{\partial}{\partial x} (x^2 y + yz) = \frac{\partial}{\partial x} (x^2 y) + \frac{\partial}{\partial x} (\underline{yz}) \\ &= y \frac{\partial}{\partial x} (x^2) + 0 \\ &= (2xy) \end{aligned}$$

$$\begin{aligned} \frac{\partial U}{\partial y} &= x^2 \frac{\partial}{\partial y} (y) + z \cdot \frac{\partial}{\partial y} (y) \\ &= (x^2 + z) \end{aligned}$$

$$\frac{\partial U}{\partial z} = \frac{\partial}{\partial z} (\underbrace{x^2}_{\downarrow 0} \underbrace{y}_{\rightarrow c}) + \underline{y} \underbrace{\frac{\partial}{\partial z} (z)}_{\downarrow 1} = y$$

$$F = - \left[(2xy) \hat{i} + (x^2 + z) \hat{j} + y \hat{k} \right]$$

★★

Type of Equilibrium $\Rightarrow \left(\frac{dU}{dx} = 0 \right)$

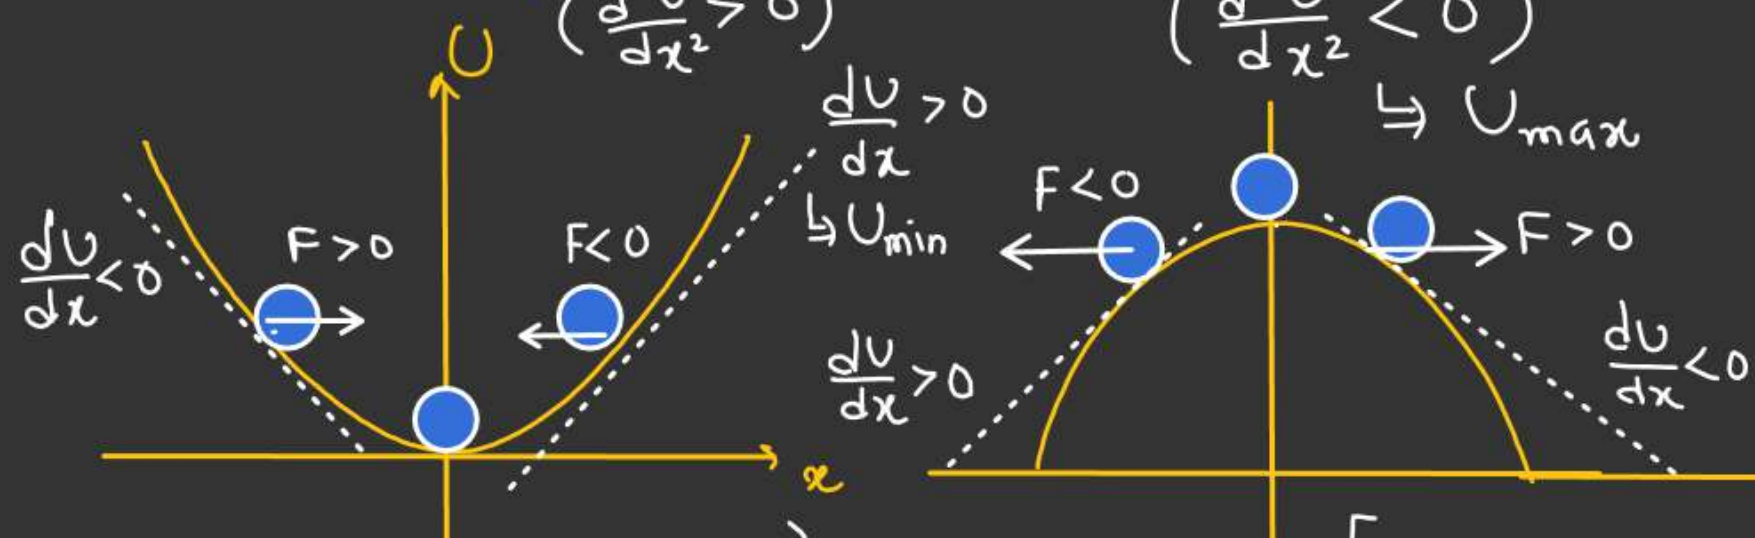

Stable Equilibrium

$\left(\frac{d^2U}{dx^2} > 0 \right)$

Unstable Equilibrium

$\left(\frac{d^2U}{dx^2} < 0 \right)$

Neutral Equilibrium

\Rightarrow Always restoring force which restore the position of the body. for stable Equilibrium.

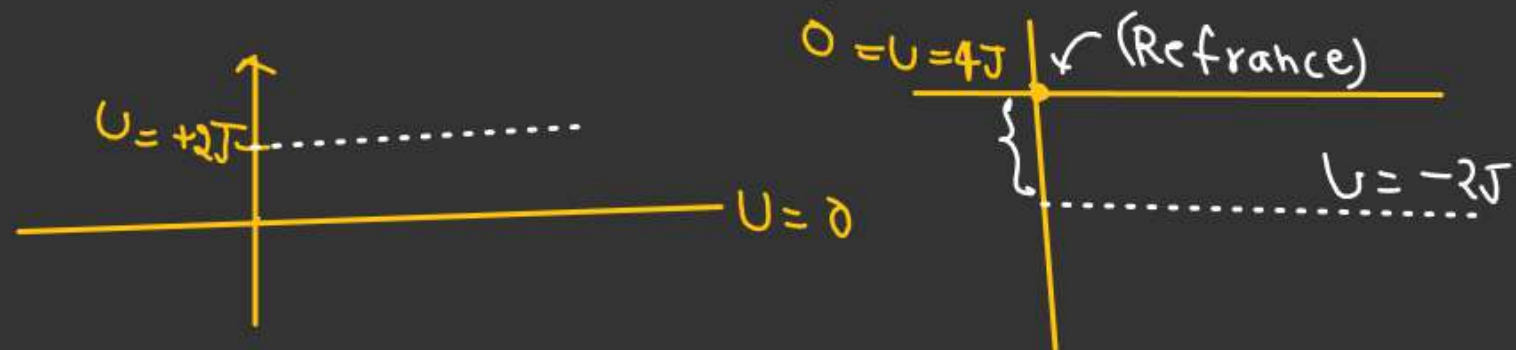

[No restoring force present for unstable Equilibrium.]

For Conservative force field

$$\begin{array}{ccccc}
 (E_T) & = & (P.E) & + & (K.E) \\
 \Downarrow & & \Downarrow & & \Downarrow \\
 \text{Total} & & P.E & & \text{Kinetic} \\
 \text{Mechanical} & & & & \text{Energy} \\
 \text{Energy} & & & &
 \end{array}$$

$$\Rightarrow K.E = \frac{1}{2}mv^2 > 0 \Rightarrow \text{Always +ve}$$

$\Rightarrow P.E$ may be +ve or -ve.
(depends on zero potential)

$\Rightarrow E_T$ also be +ve or -ve

\Rightarrow For $(K.E)_{\max}$

$$(K.E)_{\max} = E_T - P.E$$

E_T always constant.

For $(K.E)_{\max}$, $P.E$ should be minimum.

Q.1 Potential energy of a particle is related to x coordinate by equation $x^2 - 2x$.

Particle will be in stable equilibrium at :

(A) $x = 0.5$

(B) $x = 1$ ✓

(C) $x = 2$

(D) $x = 4$

$$U = x^2 - 2x$$

$$U = 0$$

$$x(x-2) = 0$$

$$x = 0, 2$$

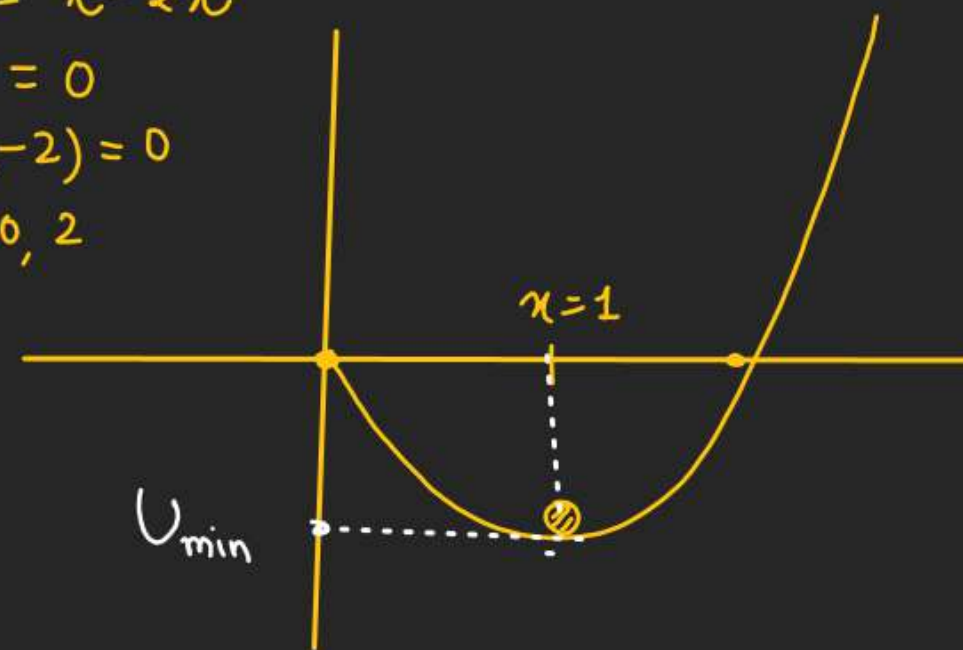

For Equilibrium

$$\frac{dU}{dx} = 0$$

$$(2x - 2) = 0$$

$$x = 1 \Rightarrow \text{Point of Equilibrium}$$

$$\frac{d^2U}{dx^2} = (2) > 0 \Rightarrow \begin{cases} \text{Point of} \\ \text{Minima} \\ \text{or Stable} \\ \text{Equilibrium} \end{cases}$$

Q.2 A particle is released from rest at origin. It moves under influence of potential field $U = x^2 - 3x$, kinetic energy at $x = 2$ is:

(A) 2 J ✓✓

(B) 1 J

(C) 1.5 J

(D) 0 J

$$U_{x=0} = 0$$

$$(K.E)_{x=0} = 0$$

$$(E_T) = U_{x=0} + (K.E)_{x=0}$$

$$(E_T) = 0$$

$$U_{x=2} = (4 - 3 \times 2)$$

$$= \underline{-2J}$$

$$At \ x=2$$

$$E_T = U_{x=2} + (K.E)_{x=2}$$

$$\Downarrow$$

$$0 = U_{x=2} + (K.E)_{x=2}$$

$$(K.E)_{x=2} = -(U_{x=2})$$

$$= -(-2J)$$

$$= \underline{+2J} \quad \checkmark$$

Q.6 A particle of mass m is moving in a horizontal circle of radius r under a centripetal force equal to $\left(-\frac{k}{r^2}\right)$, where k is a positive constant. Then if kinetic energy, potential energy and mechanical energy of the particle are KE, PE and ME respectively. Which one is correct?

(A) $\text{KE} = \left(\frac{k}{2r}\right)$, $\text{PE} = -\left(\frac{k}{r}\right)$, $\text{ME} = -\left(\frac{k}{2r}\right)$

(B) $\text{KE} = \left(\frac{k}{2r}\right)$, $\text{PE} = -\left(\frac{k}{2r}\right)$, $\text{ME} = \text{zero}$

(C) $\text{KE} = \text{zero}$, $\text{PE} = \text{zero}$, $\text{ME} = \text{zero}$

(D) $\text{KE} = \left(\frac{k}{r}\right)$, $\text{PE} = -\left(\frac{k}{2r}\right)$, $\text{ME} = \left(\frac{k}{2r}\right)$

$$F_c = -\frac{k}{r^2}$$

$$\frac{mv^2}{r} = \frac{k}{r^2}$$

$$\frac{mv^2}{2} = \frac{k}{2r}$$

$$K.E = \frac{mv^2}{2} = \left(\frac{k}{2r}\right)$$

$$E_T = K.E + P.E$$

$$= \left(\frac{k}{2r} - \frac{k}{r}\right) = \left(-\frac{k}{2r}\right)$$

$$F = -\frac{dU}{dr}$$

$$\int_0^U dU = -\int_0^r F \cdot dr$$

$$U = k \int_0^r \frac{dr}{r^2} = \left(-\frac{k}{r}\right)$$

Q.9 The force between two atoms in a diatomic molecule can be represented approximately by the potential energy function

$$U = U_0 \left[\left(\frac{a}{x} \right)^{12} - 2 \left(\frac{a}{x} \right)^6 \right]$$

where U_0 and a are constants.

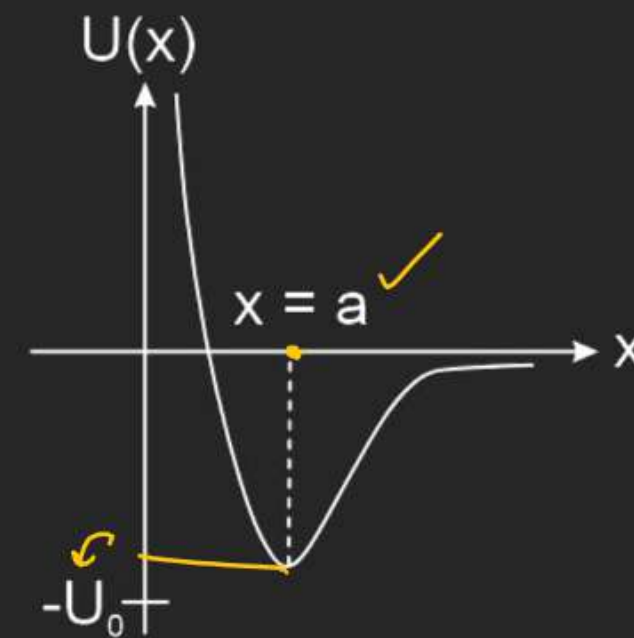

(a) At what value of x is the potential energy zero?

(b) Find the force F_x .

(c) At what value of x is the potential energy a minimum?

→ At $x=a$ P.E minimum.

$$U_{x=a} = ?$$

$$a) U = 0$$

$$U_0 \left(\frac{a}{x} \right)^6 \left[\left(\frac{a}{x} \right)^6 - 2 \right] = 0$$

$$\left(\frac{a}{x} \right)^6 = 2$$

$$\frac{a}{x} = (2)^{1/6} \Rightarrow x = \frac{a}{(2)^{1/6}}$$

$$U = U_0 \left[\left(\frac{a}{x} \right)^{12} - 2 \left(\frac{a}{x} \right)^6 \right]$$

$$U = U_0 \left[a^{12} (x^{-12}) - 2a^6 \cdot x^{-6} \right]$$

$$F = -\frac{dU}{dx} = -U_0 \left[a^{12} \frac{d}{dx} (x^{-12}) - 2a^6 \frac{d}{dx} (x^{-6}) \right]$$

$$F = -U_0 \left[a^{12} (-12) x^{-13} - 2a^6 (-6) x^{-7} \right]$$

$$F = -U_0 \left[-\frac{12a^{12}}{x^{13}} + \frac{12a^6}{x^7} \right]$$

$$F = -U_0 12a^6 \left[\frac{1}{x^7} - \frac{a^6}{x^{13}} \right]$$

$$|E_T| = (K \cdot E) = \frac{|P \cdot E|}{2}$$

$$\Downarrow$$

$$F \propto \frac{1}{r^2}$$

only true for F follow inverse square law.
