1. $q_1 = 2 \times 10^{-3} \text{ C}$ $q_2 = -3 \times 10^{-6} \text{ C}$

Nature:- Attractive [because charges are opposite in nature]

$$|F| = \frac{1}{4\pi\epsilon_0} \frac{q_1 q_2}{r^2} = \frac{9 \times 10^9 \times 2 \times 10^{-3} \times 3 \times 10^{-6}}{(10^{-1})^2}$$

$$r = 10 \text{ cm} = 10^{-1} \text{ m} = \frac{54 \times 10^9 \times 10^9}{10^{-2}} = 5400 \text{ N}$$

2. $(-1, 1, 1) \text{ m}$ $(3, 1, -2) \text{ m}$

$$q_1 = 20 \text{ C}$$

$$q_2 = 25 \mu\text{C}$$

$$\vec{F}_{21} = \frac{kq_1 q_2}{|\vec{r}_{12}|^3} \vec{r}_{12} \quad \vec{r}_{12} = \vec{r}_2 - \vec{r}_1$$

$$\hat{r}_{12} = \frac{4\hat{i} - 3\hat{k}}{5}$$

$$|\vec{r}_{12}| = \sqrt{16 + 9} = 5 \text{ m}$$

$$|\vec{F}_{22}| = \frac{5 \times 10^9 \times 20 \times 10^{-6} \times 25 \times 10^{-6}}{28} = 18 \times 10^{-2} = 0.18 \text{ N}$$

3. q_0 q_1 q_2 q_3

1C 10^{-6} C 8×10^{-6} 27×10^{-6} $8000 \times 10^{-6} \text{ C}$

$x = 0$ $x = 1$ $x = 2$ $x = 3$ $x = 20$

Fnet on 1c due to all charges

$$F = \frac{kq_0 q_1}{1^2} + \frac{kq_0 q_2}{2^2} + \dots + \frac{kq_0 q_{20}}{(20)^2}$$

$$F = Kq_0 \left[\frac{10^{-6}}{1} + \frac{8 \times 10^{-6}}{4} + \frac{27 \times 10^{-6}}{9} + \dots + \frac{8000 \times 10^{-6}}{400} \right]$$

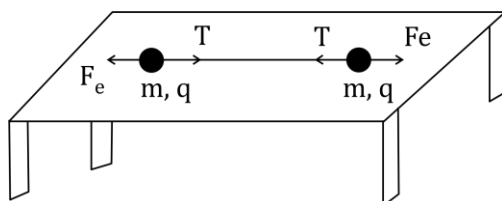

$$F = 9 \times 10^9 \times 10^{-6} [1 + 2 + 3 + \dots + 20]$$

$$F = 9 \times 10^3 [210] = 189 \times 10^4 = 1.89 \times 10^6 \text{ N}$$

<p>use sum of AP $a = 1, d = 1, n = 20$</p> <p>$S_n = \frac{n}{2} [2a + (n-1)d]$</p> <p>$= \frac{20}{2} [2 \times 1 + 19] = 21 \times 10 = 210$</p>

4. (i)

Tension $T = F_e$ (electrostatic force)

$$T = \frac{1}{4\pi\epsilon_0} \frac{q^2}{l^2} \Rightarrow T = 9 \times 10^9 \times 16 \times 10^{-12}$$

$$T = 144 \times 10^{-3} = .144 \text{ N}$$

(ii) After cut the string $T = 0$ only F_e is act.

$$F_e = ma \Rightarrow a = \frac{F_e}{m} = \frac{.144}{24 \times 10^{-3}}$$

$$a_1 = 6 \text{ m/s}^2$$

(iii) In magnitude $a = 6 \text{ m/s}^2$ and direction is opposite.

5. Let charges are q_1 & q_2

$$\text{First } F = \frac{kq_1q_2}{(0.5)^2} = 0.108 \text{ N} \quad \dots (1)$$

After touching

$$\frac{k(q_1 + q_2)^2}{4(0.5)^2} = 0.036 \text{ N} \quad \dots (ii)$$

After Solving 1 & 2

$$q_1 = \pm 1 \times 10^{-6} \text{ C} \quad q_2 = \mp 3 \times 10^{-6} \text{ C}$$

6. $T \cos \theta = mg$

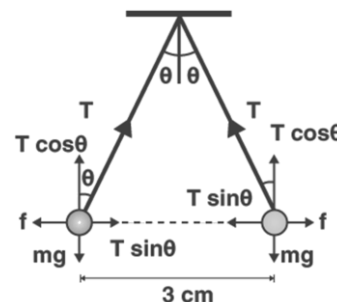

Here, T is the tension force, m is the mass of the sphere, g is the acceleration due to gravity, and θ is the angle.

$$T \cos \theta = 0.1 \times 10^{-3} \text{ kg} \times \frac{10 \text{ m}}{\text{s}^2} \Rightarrow T \cos \theta = 10^{-3} \text{ N}$$

$$\Rightarrow T \sin \theta = \frac{kq^2}{r^2} \Rightarrow \frac{T \sin \theta}{T \cos \theta} = \frac{\frac{9 \times 10^9 \text{ Nm}^2/\text{C}^2 \times (10^{-9} \text{ C})^2}{(3 \text{ cm} \times \frac{1 \text{ m}}{100 \text{ cm}})^2}}{10^{-3} \text{ N}}$$

$$\tan \theta = \frac{1}{100} \Rightarrow \theta = \tan^{-1} \left(\frac{1}{100} \right)$$

$$\theta = 0.6^\circ$$

Link to View Video Solution: [Click Here](#)

7. $F_{qe} = F_{q,4e}$ at equilibrium position

$$\frac{kq}{x^2} = \frac{K4eq}{(\ell + x)^2} \Rightarrow (\ell + x)^2 = 4x^2$$

$$\ell + x = 2x$$

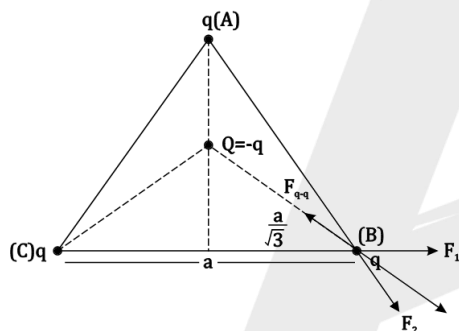

$$\Rightarrow x = \ell \Rightarrow x = \ell$$

$\Rightarrow q \rightarrow$ Placed ℓ from e.

$\Rightarrow q = +$ ive [stable]

$q = -$ ive [unstable]

8. (a)

$$F_{q(-q)} = \frac{kq^2 \times 3}{a^2} = \frac{3kq^2}{a^2}$$

Force on

$$q(B) = \sqrt{F_1^2 + F_2^2} = \frac{kq^2}{a^2} \sqrt{3}$$

So net force on $q(B)$ towards $(-q)$

(b) First we find net force on corner charge (q)

$$\Rightarrow \frac{kqQ}{\left(\frac{a}{\sqrt{3}}\right)^2} + \frac{kq^2\sqrt{3}}{a^2} = 0$$

$$\Rightarrow \frac{3kqQ}{a^2} = \frac{-kq^2\sqrt{3}}{a^2}$$

$$\Rightarrow \boxed{Q = -\frac{q}{\sqrt{3}}}$$

Link to View Video Solution:  [Click Here](#)

9. F_{net} on q

$$= 2F \cos \theta$$

$$= \frac{2kqQ}{\left[\left(\frac{d}{2}\right)^2 + x^2\right]} \times \frac{x}{\left(x^2 + \frac{d^2}{4}\right)^{1/2}} = \frac{2kqQx}{\left[x^2 + \left(\frac{d}{2}\right)^2\right]^{3/2}}$$

$$\text{For } F \text{ max } \frac{dF}{dx} = 0 \Rightarrow \frac{d}{dx} \frac{2kqQx}{\left[x^2 + \left(\frac{d}{2}\right)^2\right]^{3/2}}$$

$$2kqQ \frac{d}{dx} \left(\frac{x}{\left[x^2 + \left(\frac{d}{2}\right)^2\right]^{3/2}} \right) = 0$$

$$x \times \frac{3}{2} \left(x^2 + \frac{d^2}{4}\right)^{-1/2} \cdot 2x - \left(x^2 + \frac{d^2}{4}\right)^{3/2} \cdot 1 = 0$$

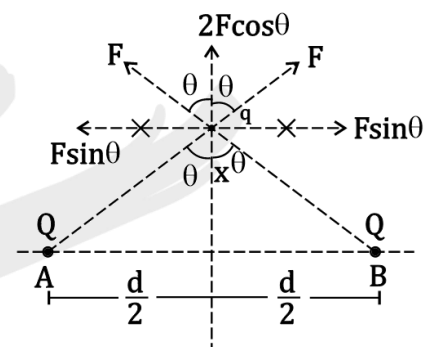

$$\frac{3x}{2} \left(x^2 + \frac{d^2}{4}\right)^{1/2} \cdot 2x = \left(x^2 + \frac{d^2}{4}\right)^1 \left(x^2 + \frac{d^2}{4}\right)^{1/2}$$

$$3x^2 = x^2 + \frac{d^2}{4}$$

$$\Rightarrow 2x^2 = \frac{d^2}{4}$$

$$\Rightarrow x^2 = \frac{d^2}{4 \times 2}$$

$$\Rightarrow \boxed{x = \frac{d}{2\sqrt{2}}}$$

10. $q_1(2, -1, 3)$ $q_2(0, 0, 0)$

$$\vec{F}_{21} = \frac{1}{4\pi\epsilon_0} \frac{q_1 q_2}{r_{12}^3} (\vec{r}_{12})$$

$$\vec{r}_{12} = (-2\hat{i} + \hat{j} - 3\hat{k}) \quad |\vec{r}_{12}| = \sqrt{14}$$

$$\vec{F}_{21} = \frac{1}{4\pi\epsilon_0} \frac{q_1 q_2}{14\sqrt{14}} (\hat{j} - 2\hat{i} - 3\hat{k})$$

$$\vec{F}_{21} = \frac{q_1 q_2}{56\sqrt{14}\pi\epsilon_0} (\hat{j} - 2\hat{i} - 3\hat{k})$$

Link to View Video Solution: [Click Here](#)

11.
$$\begin{array}{ccccc} 4q & & Q & & q \\ | & \ell/2 & | & \ell/2 & | \end{array}$$

F_{net} on q

$$\Rightarrow \frac{4kqq}{l^2} + \frac{4kqQ}{l^2} = 0$$

$$\boxed{Q = -q}$$

12.
$$\begin{array}{ccc} \text{Initially} & & \text{finally} \\ 40 \mu\text{C} & \xrightarrow{d} & -20 \mu\text{C} \\ & & 10 \mu\text{C} \quad d \quad 10 \mu\text{C} \end{array}$$

$$F_1 = \frac{K40 \times 20}{d^2} \quad F_2 = \frac{k \times 10 \times 10}{d^2}$$

$$\frac{F_1}{F_2} = 8:1$$

13. Initially

$$\begin{array}{ccc} q_1 & \xrightarrow{r} & q_2 \\ & \text{Air} & \end{array}$$

$$F = \frac{1}{4\pi\epsilon_0} \frac{q_1 q_2}{r^2}$$

Finally

$$\begin{array}{ccc} & \text{medium} & \\ q_1 & \xrightarrow{R} & q_2 \\ & \text{R} & \end{array}$$

$$F' = \frac{1}{4\pi\epsilon_0 \times 16} \frac{q_1 q_2}{R^2} = 4F$$

$$\frac{1}{4\pi\epsilon_0 \times 16} \frac{q_1 q_2}{R^2} = 4 \times \frac{1}{4\pi\epsilon_0} \frac{\epsilon_0 q_2}{r^2}$$

$$r^2 = 64R^2 \Rightarrow r = 8R$$

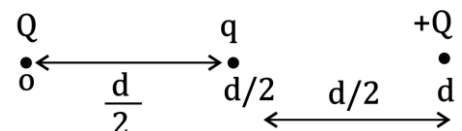

$$R = r/8$$

14. F_{net} on Q (Placed at 0) = 0

$$\frac{kQq}{d^2/4} + \frac{kQ^2}{d^2} = 0$$

$$\frac{4kqQ}{d^2} = \frac{-kQ^2}{d^2}$$

$$q = -Q/4$$

Link to View Video Solution: [Click Here](#)

$$15. \quad F_{\text{net}} = 2F \cos \theta = 2 \frac{k \cdot q \cdot q/2}{(\sqrt{a^2+y^2})^2} \cdot \frac{y}{\sqrt{a^2+y^2}} = \frac{kq^2 y}{(a^2+y^2)^{3/2}}$$

As $y \ll a$ we write

$$F_{\text{net}} = \frac{kq^2 y}{(a^3)} \Rightarrow \text{i.e. } F \propto y$$

$$16. \quad \tan \theta = \frac{F_e}{mg} \Rightarrow \tan \theta = \frac{kq^2}{x^2 mg}$$

$$\tan \theta \rightarrow \sin \theta [x \ll \ell]$$

$$\frac{x}{2\ell} = \frac{kq^2}{x^2 mg} \Rightarrow x^3 \propto q^2$$

$$q \propto x^{3/2} \Rightarrow \text{diff both Side w.r.t } t$$

$$\frac{dq}{dt} \propto \frac{d}{dt} (x^{3/2}) \Rightarrow \frac{dq}{dt} = \text{Constant [given]}$$

$$\Rightarrow \frac{dq}{dt} \propto \frac{3}{2} x^{1/2} \frac{dx}{dt} \Rightarrow \frac{dq}{dt} = \frac{3}{2} x^{1/2} \cdot v$$

$$v \propto x^{-1/2}$$

17. From fig,

$$\tan \theta = F_e/mg \Rightarrow \tan 15^\circ = \frac{kq^2}{d^2 mg}$$

$$\tan 15^\circ = \frac{kq^2}{1.6Vgd^2} \dots [V \text{ is the volume}]$$

When system is suspended in liquid,

$$\tan 15^\circ = \frac{kq^2}{K(mg - \rho Vg)d^2}$$

$$\tan 15^\circ = \frac{kq^2}{K(1.6 - 0.8)Vgd^2} \dots (2)$$

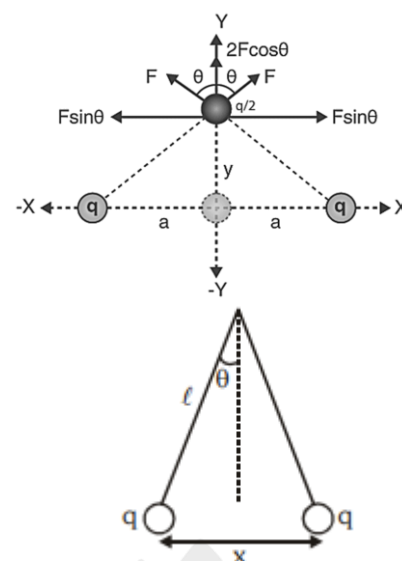

from (1) and (2) we get,

$$\frac{kq^2}{K(1.6 - 0.8)Vgd^2} = \frac{kq^2}{1.6Vgd^2}$$

$\therefore K = 2 = \text{Dielectric constant of liquid.}$

18. It is obvious that by charge conservation law, electronic charge must be independent of the acceleration due to gravity. Hence it will remain constant irrespective of where the experiment is performed.

$$\text{Hence } \frac{\text{electronic charge on moon}}{\text{electronic charge on earth}} = 1$$

Link to View Video Solution: [Click Here](#)

19. Calculation of initial force

Let A and B have charge Q each initially and are separated by r distance.

From Coulomb's law, force between them $F = \frac{KQ^2}{r^2}$

Distribution of charges

When an identical uncharged spherical conductor C is brought in contact with charged sphere B. By symmetry, the total charge will be shared equally among them, as both have equal radii.

\therefore Charge on B and C = $\frac{Q}{2}$

Now, when the conductor A is brought in contact with C.

They will also share equal charge among themselves, as both have equal radii.

\therefore Charge on A and C = $\frac{Q + \frac{Q}{2}}{2} = \frac{3Q}{4}$

Calculation of new force

New coulomb force between B and C:

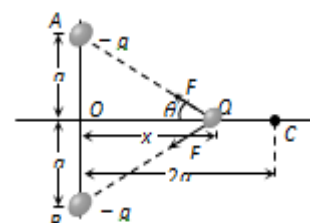

$$F' = \frac{K \frac{Q}{2} \times \frac{3Q}{4}}{r^2} = \frac{3}{8} \frac{KQ^2}{r^2}$$

From equation (1), we get: $F' = \frac{3}{8} F$

20. The net force is given as,

$$F_{\text{net}} = 2F \cos \theta$$

$$\vec{F} = 2 \times \frac{1}{4\pi\epsilon_0} \left(\frac{qQ}{a^2 + x^2} \right) \times \left(\frac{-x}{(a^2 + x^2)^{\frac{1}{2}}} \right)$$

Thus, the restoring force is not linear, So, the motion will not be simple harmonic motion but the motion will be oscillatory.

21. Charge q is in equilibrium since charges A and B exert equal and opposite forces on it.

For equilibrium of charge Q at B;

$$F_{BC} + F_{AB} = 0$$

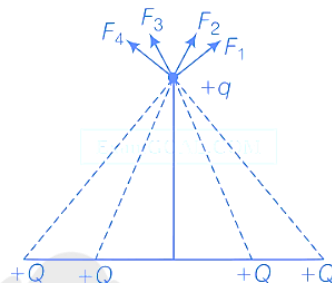

$$\Rightarrow \frac{1}{4\pi\epsilon_0} \frac{qQ}{(L/2)^2} + \frac{1}{4\pi\epsilon_0} \frac{Q \cdot Q}{L^2} = 0$$

$$\Rightarrow \frac{1}{4\pi\epsilon_0} \frac{Q}{L^2} (4q + Q) = 0 \Rightarrow q = -\frac{Q}{4}$$

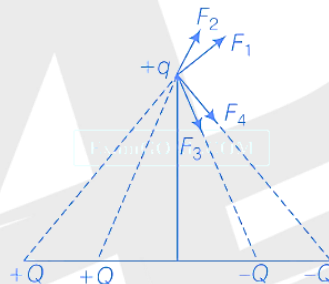

Link to View Video Solution: [Click Here](#)

22. Explanation

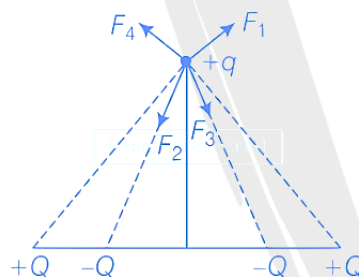

(P) Component of forces along x-axis will vanish. Net force along positive y-axis.

(Q) Component of forces along y-axis will vanish. Net force along positive x-axis

(S) Component of forces along y-axis will vanish. Net force along negative x-axis.

23. Let the balls be deviated by an angle θ , from the vertical when separation between them equals x .

Applying Newton's second law of motion for any one of the sphere, we get, $T \cos \theta = mg$ (1)

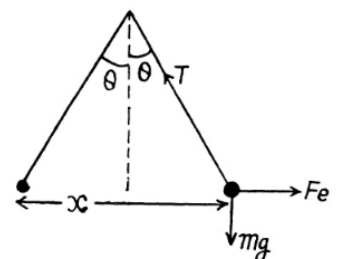

and $T \sin \theta = F_e$ (2)

From the Eq. (1) and (2)

$$\tan \theta = \frac{F_e}{mg} \quad (3)$$

But from the figure

$$\tan \theta = \frac{x}{2\sqrt{\ell^2 - \left(\frac{x}{2}\right)^2}} = \frac{x}{2\ell} \text{ as } x \ll \ell \text{ From Eq. (3) and (4)}$$

Link to View Video Solution:  [Click Here](#)

$$F_e = \frac{mgx}{2\ell} \text{ or } \frac{q^2}{4\pi\epsilon_0 x^2} = \frac{mgx}{2\ell}$$

Thus

$$q^2 = \frac{2\pi\epsilon_0 mgx^3}{\ell} \dots (5)$$

Differentiating Eqn. (5) with respect to time

$$2q \frac{dq}{dt} = \frac{2\pi\epsilon_0 mg}{\ell} 3x^2 \frac{dx}{dt}$$

According to the problem $\frac{dx}{dt} = v = a\sqrt{x}$ (approach velocity is $\frac{dx}{dt}$)

$$\text{So, } \left(\frac{2\pi\epsilon_0 mg}{\ell} x^3 \right)^{1/2} \frac{dq}{dt} = \frac{3\pi\epsilon_0 mg}{\ell} x^2 \frac{a}{\sqrt{x}}$$

$$\text{Hence, } \frac{dq}{dt} = \frac{3}{2} a \sqrt{\frac{2\pi\epsilon_0 mg}{\ell}}.$$
