

F-Block

last e^- of these elements
entered in $(n-2)f$ sub shell
So they are also called
inner transition element

Lanthanides

$L_n = \text{last } e^- \text{ in } 4f \rightarrow 5d$

$A_n = \text{last } e^- \text{ in } 5f \rightarrow 6d$

d-block

elements

f subshell not regularly fill
but in tripositive ion
regularly filling

Ce सिर $4f^1 5d^1 6s^2$

Pr पर लेकर $4f^3 6s^2$

Nd नो दिये $4f^4 6s^2$

Pm परमेखरी $4f^5 6s^2$

Sm समझाये $4f^6 6s^2$

Eu यो $4f^7 6s^2$

Gd गद $4f^7 5d^1 6s^2$

Tb तब $4f^9 6s^2$

Dy दियो $4f^{10} 6s^2$

Ho हो $4f^{11} 6s^2$

Er इर $4f^{12} 6s^2$

Tm तुम $4f^{13} 6s^2$

Yb इव $4f^{14} 6s^2$

Lu लुवाये $4f^{14} 5d^1 6s^2$

tripositive ion

$4f^1$

$4f^2$

$4f^3$

$4f^4$

$4f^5$

$4f^6$

$4f^7$

$4f^8$

$4f^9$

$4f^{10}$

$4f^{11}$

$4f^{12}$

$4f^{13}$

$4f^{14}$

$4f^{15}$

$4f^{16}$

$4f^{17}$

$4f^{18}$

$4f^{19}$

$4f^{20}$

Oxidation state

Stable oxidation = +3
state

$Tb^{+4} = 4f^7$ (half filled)
(O.A)

+2 (R.A)

+3

+4

(O.A)

$Ce^{+4} \rightarrow$ due to noble gas conf.

(O.A)

$Ce^{+4} / Ce^{+3} = 1.74$

$\Delta G = -nFE^0$

It good oxidising and it oxidise
water
and use for analytic chemistry

$$\begin{cases} E_u^{+2} = 4f^7 \rightarrow (R \cdot A) \\ \chi_b^{+2} = 4f^{14} \rightarrow (R \cdot A) \\ (R \cdot A) \end{cases}$$

magnetic prop. \rightarrow paramag behavior \uparrow up \rightarrow [Nd]
after this paramag nature \downarrow

Nd \rightarrow highest paramag.

only Pm is Synthetic
radioactive

Physical prop.

- ① They are white silvery metal, their metallic surface rapidly tarnish on air
- ② They m.p ↓, range 1000 – 1200 K
Sm m.p is 1623 K
- ③ they are soft but sm being steel Hard.
- ④ their Hardness increases with atomic number
- * ④ alloy of Lanthanide is called mischmetal
Lanthide [95%] Fe (5%) and
Ca | S | Cl | Al (traces)

(5) I.E \rightarrow I I.E of lanthanides
 is 600 KJ/mole and II I.E
 is 1200 KJ/mole and it is
 comparable with Ca

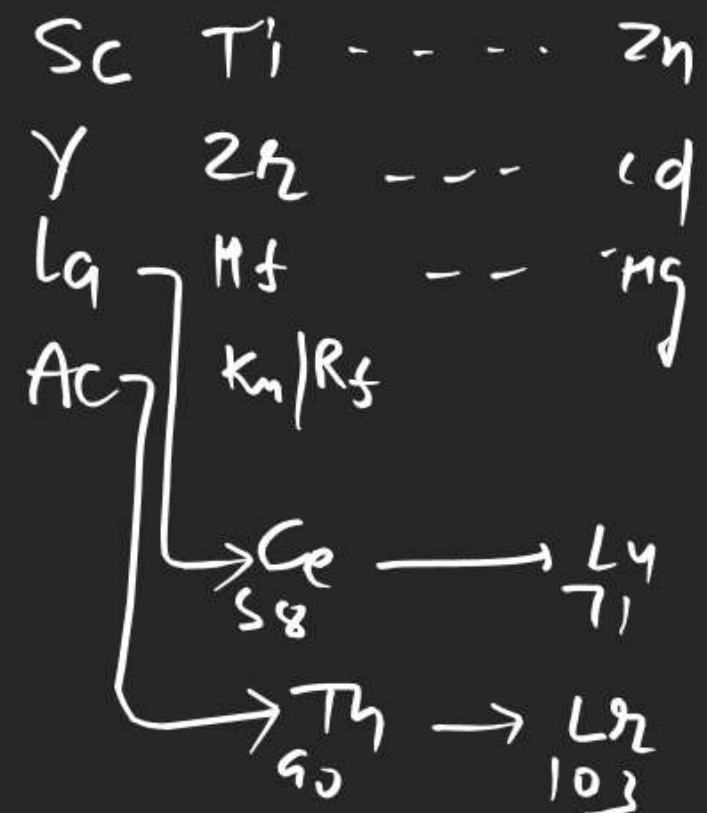

order of size

basic order

Lanthanide contraction

$$3d < 4d \approx 5d$$

due to lanthanide contraction due to

$$\text{Ti} < \text{Zr} \approx \text{Hf}$$

160 pm 159 pm

poor S.E. of 4f
subshell

Chemical prop.

actinides

AC पे

No ना	
Lr लाओ	

${}_{90}\text{Th}$ ${}_{91}\text{Pa}$ ${}_{92}\text{U} \Rightarrow$ Natural
 Radioactive
 element

${}_{93}\text{Np} \rightarrow {}_{103}\text{Lr} =$ Synthetic
 Radioactive

all actinides are
radioactive

Stable O.S = +3

and it is more stable than Lanthanide

highest oxidation state is +7 NP, Pu
but it unstable

highest stable oxidation state +6 U

a Actinide contraction

due to poor S.E of 5f sub shell
and it is greater than the Lanthanide
Contraction. due to different shape of 5f

Colour \rightarrow

f^1 to f^{13} Col'ful

f^0 and f^{14} Colourless

f^n and f^{14-n} = Same Colour
