

Introduction:

In the thermodynamics, we have studied whether a reaction will take place or not and if it does then upto what extent. In this chapter (chemical kinetics) we will study about how fast a chemical reaction takes place and what are the different factors affecting this rate of chemical reaction. How to optimise the conditions as to maximise the output in optimum time. The last part of chapter will be dealing with the mechanism of a chemical reaction and catalysis.

1.1 Rate/Velocity of chemical reaction:

The rate of change of concentration with time of different chemical species taking part in a chemical reaction is known as rate of reaction of that species.

$$\text{Rate} = \frac{\Delta c}{\Delta t} = \frac{\text{mol/lit}}{\text{sec}} = \text{mol lit}^{-1} \text{time}^{-1} = \text{mol dm}^{-3} \text{time}^{-1}$$

For gaseous reactions, when concentration of gases is expressed in terms of their partial pressure, then units of rate equation will be atms^{-1} .

Rate is always defined in such a manner so that it is always a positive quantity.

1.2 Types of Rates of chemical reaction:

For a reaction $R \rightarrow P$

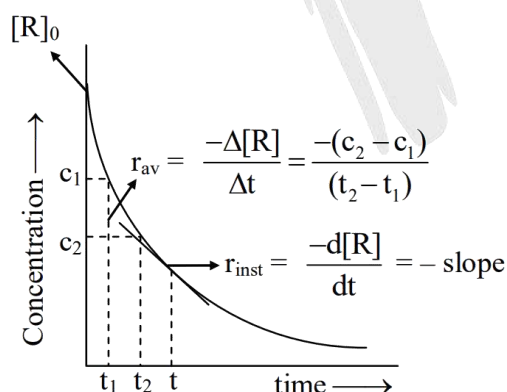

$$\text{Average rate} = \frac{\text{Total change in concentration}}{\text{Total time taken}} = \frac{\Delta c}{\Delta t} = -\frac{\Delta[R]}{\Delta t} = \frac{\Delta[P]}{\Delta t}$$

Instantaneous rate : rate of reaction at a particular instant.

$$R_{\text{instantaneous}} = \lim_{t \rightarrow 0} \left[\frac{\Delta c}{\Delta t} \right] = \frac{dc}{dt} = -\frac{d[R]}{dt} = \frac{d[P]}{dt}$$

Instantaneous rate can be determined by drawing a tangent at time t on curve drawn for concentration versus time.

Initial Rate: Instantaneous rate at ' $t = 0$ ' is called initial rate [slope of tangent at $t = 0$].

1.3 Relation between reaction rates of different species involved in a reaction :

For the reaction: $\text{N}_2 + 3\text{H}_2 \rightarrow 2\text{NH}_3$

$$\text{Rate of reaction of } \text{N}_2 = -\frac{d[\text{N}_2]}{dt}; \quad \text{Rate of reaction of } \text{H}_2 = -\frac{d[\text{H}_2]}{dt}$$

$$\text{Rate of reaction of } \text{NH}_3 = -\frac{d[\text{H}_2]}{dt}$$

These rates are not all equal. Therefore by convention the rate of a reaction is defined as

$$\text{Rate of reaction} = -\frac{d[\text{N}_2]}{dt} = -\frac{1}{3}\frac{d[\text{H}_2]}{dt} = \frac{1}{2}\frac{d[\text{NH}_3]}{dt}$$

Note: Rate of reaction value is dependent on the stoichiometric coefficients used in the reaction while rate of any species will be fixed value under given conditions.

Ex.1 For each reaction below, express the rates of change of [product] and [reactant] in the correct relationship to each other.

Sol.

$$(a) -\frac{1}{2}\frac{d[\text{O}_3]}{dt} = +\frac{1}{3}\frac{d[\text{O}_2]}{dt}$$

$$\frac{-d[\text{O}_3]}{dt} = \frac{2}{3}\frac{d}{dt}[\text{O}_2]$$

$$(b) -\frac{1}{2}\frac{d[\text{HOF}]}{dt} = +\frac{1}{2}\frac{d[\text{HF}]}{dt} = +\frac{d[\text{O}_2]}{dt}$$

$$\frac{-d[\text{HOF}]}{dt} = +\frac{d[\text{HF}]}{dt} = +\frac{2d[\text{O}_2]}{dt}$$

Ex-2. From the concentrations of R at different times given below, calculate the average rate of the reaction:

Sol. We can determine the difference in concentration over different intervals of time and thus determine the rate by dividing $\Delta[\text{R}]$ by Δt .

$\frac{1}{2}\frac{d[\text{NH}_3]}{dt}$	$\frac{[\text{R}]_2 \times 10^3}{\text{mol L}}$	$\frac{t_2}{\text{s}}$	$\frac{t_1}{\text{s}}$	$\frac{r_{av} \times 10^3}{\text{mol L}^{-1} \text{s}^{-1}} = \frac{-[\text{R}_2 - \text{R}_1] \times 10^3}{[t_2 - t_1]}$
160	80	5	0	16
80	40	10	5	8
40	10	20	10	3
10	2.5	30	20	0.75

2. Factors affecting rate of chemical reaction:

1. Concentration 2. Catalyst 3. Radiations/light 4. Temperature

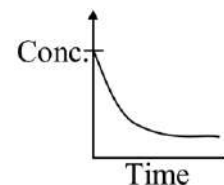

5. pH of the solution 6. Pressure 7. Nature of reactants and products

8. Dielectric constant of the medium. 9. Electrical and magnetic field.

The first four factors generally affect rate of almost all reactions while other factors are specific to some reactions only.

2.1. Effect of concentration:

We know from law of mass action that Rate is proportional to concentration of reactants. " So rate of reaction decreases with passage of time, since concentration of reactants decreases.

**2.2 Effect of temperature:**

Most of the chemical reactions are accelerated by increases in T. This will be discussed in detail further.

2.3 Effect of nature of reactants and Products:

(a) Physical state of reactants :

Gaseous state > Liquid state > Solid state

Decreasing order of rate of reaction.

because collisions in homogeneous system are more effective than heterogeneous system.

(b) Physical size of reactants : As we decrease the particle size rate of reaction increases since surface area increases.

(c) Chemical nature of reactants :

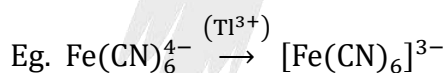

- If more bonds are to be broken, the rate of reaction will be slow.
- Similarly bond strength is more, rate of reaction will be slow.

2.4 Effect of Catalyst:

- Presence of positive catalyst lowers down the activation energy hence increases the rate of reaction.
- Presence of negative catalyst increases activation energy hence decreases the rate of reaction.

2.5 Effect of pH of solution:

Few reactions take place only in a particular medium.

This reaction takes place with appreciable rate in acidic medium, but does not take place in basic medium.

2.6 Effect of dielectric constant of the medium:

More is the dielectric constant of the medium greater will be the rate of ionic reactions.

2.7 Effect of radiations/light: Radiation are useful for photochemical reaction.

Effect of pressure: Pressure is important factor for gaseous reaction.

2.9 Effect of electrical & Magnetic field

Electric and magnetic fields are rate determining factors if a reaction involves polar species.

3. Rate Law (Dependence of rate on concentration of reactants):

The representation of rate of reaction in terms of the concentration of the reactants is called the rate law.

It can only be established by experiments.

Generally rate law expressions are not simple and these may differ for the same reaction on conditions under which the reaction is being carried out.

But for large number of reactions starting with pure reactants we can obtain simple rate laws.

For these reactions :

$$\text{Rate} \propto (\text{conc.})^{\text{order}}$$

Rate = K (conc.)^{order} This is the differential rate equation or rate expression/Rate law.

Where K = Rate constant = specific reaction rate = rate of reaction when concentration is unity
unit of K = (conc)^{1-order} time⁻¹

K depend on temperature only and not on concentration.

Note: Value of K is a constant for a given reaction, depends only on temperature.

3.1 Order of reaction :

Let there be a reaction, $m_1 A + m_2 B \rightarrow \text{products}$.

Now, if on the basis of experiment, we find that

$R \propto [A]^p [B]^q$ where p may or may not be equal to m_1 and similarly q may or may not be equal to m_2 .

p is order of reaction with respect to reactant A and q is order of reaction with respect to reactant B and (p + q) is overall order of the reaction.

Note: Order of a reaction can be 'zero' or any whole number, it can be a fractional number and it can even be negative with respect to a particular reactant. But overall order is not found to be negative for any reaction till observed.

Examples showing different values of order of reactions:

Reaction	Rate law	Order
(i) $2 \text{N}_2\text{O}_5(\text{g}) \rightarrow 4\text{NO}_2(\text{g}) + \text{O}_2(\text{g})$	$R = K[\text{N}_2\text{O}_5]^1$	1
(ii) $5\text{Br}^-(\text{aq}) + \text{BrO}_3^-(\text{aq}) + 6\text{H}^+(\text{aq})$	$R = K[\text{Br}^-][\text{BrO}_3^-][\text{H}^+]^2$	$1 + 1 + 2 = 4$
	$\rightarrow 3\text{Br}_2(\ell) + 3\text{H}_2\text{O}$	

(iii) H_2 (Para) \rightarrow H_2 (ortho)	$R = K[\text{H}_2(\text{Para})]^{3/2}$	3/2
(iv) $\text{NO}_2(\text{g}) + \text{CO}(\text{g}) \rightarrow \text{NO}(\text{g}) + \text{CO}_2(\text{g})$	$R = K[\text{NO}_2]^2[\text{CO}]^0$	$2 + 0 = 2$
(v) $2\text{O}_3(\text{g}) \rightarrow 3\text{O}_2(\text{g})$	$R = K[\text{O}_3]^2[\text{O}_2]^{-1}$	$2 - 1 = 1$
(vi) $\text{H}_2 + \text{Cl}_2 \xrightarrow{h\nu} 2\text{HCl}$	$R = K[\text{H}_2]^0[\text{Cl}_2]^0$	$0 + 0 = 0$

The reaction (ii) does not take place in one single step. It is almost impossible for all the 12 molecules of the reactants to be in a state of encounter simultaneously. Such a reaction is called complex reaction and takes place in a sequence of a number of elementary reactions. For an elementary reaction the sum of stoichiometric coefficients = order of the reactions. But for complex reactions order is to be experimentally calculated.

3.2 Molecularity:

The number of molecules that react in an elementary step is the molecularity of the elementary reaction. Molecularity is defined only for the elementary reactions and not for complex reactions. No elementary reactions involving more than three molecules are known, because of very low probability of near-simultaneous collision of more than three molecules.

The rate law for the elementary reaction

$a\text{A} + b\text{B} \rightarrow \text{products}$ rate = $k[\text{A}]^a[\text{B}]^b$, where $a + b = 1, 2$ or 3 .

For an elementary reaction, the orders in the rate law equal the coefficients of the reactants.

While, the order is defined for complex as well as elementary reactions and is always experimentally calculated by the mechanism of the reaction, usually by the slowest step of the mechanism known as rate determining step (RDS) of the reaction.

Comparison B/W Molecularity and order of reaction		
	Molecularity of Reaction	Order of Reaction
1.	It is defined as the number of molecules of reactant taking part in a chemical reaction Eq. $\text{NH}_4\text{NO}_2 \rightarrow \text{N}_2 + 2\text{H}_2\text{O}$, $m = 1$	It is defined as the sum of the power of concentration terms that appear in rate law. $\text{NH}_4\text{NO}_2 \rightarrow \text{N}_2 + 2\text{H}_2\text{O}$. Rate = $k[\text{NH}_4\text{NO}_2]$
2.	It is always a whole number, it can neither be zero nor fractional	It may be zero, fractional or integer.
3.	It is derived from RDS in the mechanism of reaction.	It is derived from rate expression.

4.	It is a theoretical value.	It is an experimental value.
5.	Reactions with molecularity > 4 are rare.	Reactions with order of reaction > 4 are also rare.
6.	Molecularity is independent of pressure and temperature.	Order of reaction depends upon pressure and temperature.

Ex.3 Write the units of the rate constants for a (i) Zeroth order, (ii) half order, (iii) first order, (iv) 3/2 order, (v) second order, (vi) 5/2 order, (vii) third order reactions.

Sol. Unit of Rate Constant = (Mole)¹⁻ⁿ (Litre)ⁿ⁻¹ Sec⁻¹ Where n is the order of Reaction

(i) For Zeroth order = Mole⁽¹⁻⁰⁾ (Litre)⁽⁰⁻¹⁾ Sec⁻¹

Unit of K

n = 0 Mole Litre⁽⁻¹⁾ Sec⁻¹

Similarly For others

Ex.4 The reaction $\text{CO(g)} + \text{NO}_2(\text{g}) \rightarrow \text{CO}_2 + \text{NO}$ is second order in NO_2 and zero order in CO at temperatures less than 500 K.

(a) Write the rate expression for the reaction.

(b) How will the reaction rate change if the NO_2 concentration is halved?

Sol. (a) $\frac{-d}{dt}[\text{CO}] = \frac{-d}{dt}(\text{NO}_2) = K[\text{NO}_2]^2$ Order is zero w.r.t. CO but Conc. will Still change

(b) Rate of Rxn. = $K[\text{NO}_2]^2$, If Conc. of NO_2 Halved then Rate becomes One fourth.

Ex.5 In a catalytic experiment involving the Haber's process, $\text{N}_2 + 3\text{H}_2 \rightarrow 2\text{NH}_3$, the rate of reaction was measured as rate = $2 \times 10^{-4} \text{ M.s}^{-1}$. If there were no side reactions, express the rate of reaction in terms of (a) N_2 (b) H_2 ?

Sol. Rate of Reaction = $-\frac{d[\text{N}_2]}{dt} = -\frac{1}{3} \frac{d[\text{H}_2]}{dt} = +\frac{1}{2} \frac{d[\text{NH}_3]}{dt}$

(a) $2 \times 10^{-4} = -\frac{d[\text{N}_2]}{dt}$

(b) $2 \times 10^{-4} \times 3 = -\frac{d[\text{H}_2]}{dt} = 6 \times 10^{-4} \text{ MS}^{-1}$.

Ex.6 For a reaction $\text{A} + 3\text{B} \rightarrow \text{Product}$, Rate = $\{-d[\text{A}]/dt\} = k[\text{A}]^2[\text{B}]$, the expression for the rate of reaction in terms of change in the concentration of B; $\{-d[\text{B}]/dt\}$ will be :

(A) $k[\text{A}]^2[\text{B}]$ (B) $k[\text{A}]^2[3\text{B}]$ (C) $3k[\text{A}]^2[\text{B}]$ (D) $(1/3)k[\text{A}]^2[\text{B}]$

Sol. (C) For the given reaction

$\frac{-d[\text{A}]}{dt} = \frac{1}{3} \frac{-d[\text{B}]}{dt} = K[\text{A}]^2[\text{B}]$

then $\frac{-d[\text{B}]}{dt} = 3 K[\text{A}]^2[\text{B}]$

Ex.7 The rate of a certain reaction depends on concentration according to the equation :

$$\frac{-dC}{dt} = \frac{K_1 C}{1 + K_2 C}$$

What will be the order of reaction, when concentration (C) is :

- (a) very-very high, (b) very-very low.

Sol. (a) $\frac{-dC}{dt} = \frac{K_1 C}{1 + K_2 C} = \frac{K_1}{\frac{1}{C} + K_2}$

if C is very-very high then $\frac{1}{C}$ being small may be neglected.

$$\therefore \frac{-dC}{dt} = \frac{K_1}{K_2} = \text{constant, i.e., zero order reaction.}$$

(b) If C is very-very low $1 + K_2 C \approx K'$

$$\therefore \frac{-dC}{dt} = \frac{K_1 C}{K'} = \left(\frac{K_1}{K'}\right) \times \text{concentration i.e., I order reaction.}$$

DO YOURSELF-1

1. The reaction $A(g) + 2 B(g) \rightarrow C(g)$ is an elementary reaction. In an experiment involving this reaction, the initial partial pressures of A and B are $P_A = 0.40 \text{ atm}$ and $P_B = 1.0 \text{ atm}$ respectively. When pressure of C becomes 0.3 atm in the reaction the rate of the reaction relative to the initial rate is :

- (A) $\frac{1}{12}$ (B) $\frac{1}{50}$ (C) $\frac{1}{25}$ (D) none of these

2. The rate law for the dimerisation of NO_2 is

$$-\frac{d[\text{NO}_2]}{dt} = k[\text{NO}_2]^2$$

which of the following changes will change the value of the specific rate constant, k :

- (A) Doubling the total pressure on the system
(B) Doubling the temperature
(C) Both of (A) and (B)
(D) None of the above

3. Which of the following statement is incorrect?

- (A) unit of rate of disappearance is Ms^{-1}
(B) Unit of rate of reaction is Ms^{-1}
(C) Unit of rate constant k is depend on order
(D) Unit of k for first order reaction is Ms^{-1}

4. Which of the following relation is correct for k_f and k_b in an equilibrium process that contains equal moles of reactants and products.
(A) $k_f = k_b$ (B) $k_f > k_b$ (C) $k_f < k_b$ (D) we cannot predict
5. Which of the following statement is incorrect?
(A) A second order reaction must be a biomolecular elementary reaction
(B) A bimolecular elementary reaction must be a second order reaction
(C) Zero order reaction must be a complex reaction
(D) First order reaction may be complex or elementary reaction
6. The decomposition of N_2O_5 in CCl_4 at 318 K has been studied by monitoring the concentration of N_2O_5 in the solution. Initially the concentration of N_2O_5 is 2.33 mol L^{-1} and after 184 minutes, it is reduced to 2.08 mol L^{-1} . The reaction takes place according to the equation
 $2 N_2O_5(g) \rightarrow NO_2(g) + O_2(g)$
Calculate the average rate of this reaction in terms of hours, minutes and seconds. What is the rate of production of NO_2 during this period?
7. Hydrogenation of vegetable ghee at 25°C reduces the pressure of H_2 from 2 atm to 1.2 atm in 50 minute. Calculate the rate of reaction in terms of change :
(a) In pressure per minute. (b) In molarity per second.

4. Integrated rate laws :

4.1 Zero order reactions :

For a zero order reaction

General rate law is, Rate = $k[\text{conc.}]^0 = \text{constant}$

If C_0 is the initial concentration of a reactant and C_t is the concentration at time 't' then

$$\text{Rate} = k = \frac{C_0 - C_t}{t} \text{ or } kt = C_0 - C_t \text{ or } C_t = C_0 - kt \text{ Unit of } k \text{ is same as that of Rate}$$

$$= \text{mol lit}^{-1} \text{sec}^{-1}. \text{ Time for completion} = \frac{C_0}{k}$$

$$t_{1/2} \text{ (half life period) at } t_{1/2}, C_t = \frac{C_0}{2}, \text{ so } kt_{1/2} = \frac{C_0}{2} \Rightarrow t_{1/2} = \frac{C_0}{2k}$$

$$\therefore t_{1/2} \propto C_0$$

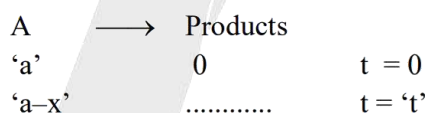

Examples of zero order reactions:

Generally decomposition of gases on metal surfaces at high concentrations follow zero order kinetics.

4.2 First Order Reactions:

(i) Let a 1st order reaction is

Let $\frac{dx}{dt}$ be the rate of reaction at time 't'

$$\therefore \frac{dx}{dt} = k(a-x)^1 \quad \text{or} \quad \frac{dx}{a-x} = k dt.$$

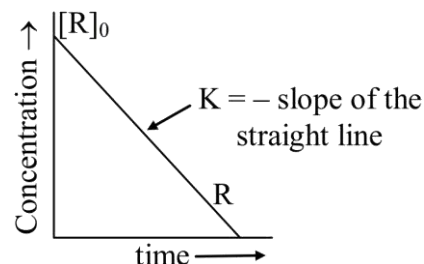

$$\text{On solving } t = \frac{2.303}{k} \log \frac{a}{a-x} \quad \text{or} \quad k = \frac{2.303}{t} \log \frac{C_0}{C_t}$$

$$k = \frac{2.303}{t} \log \frac{C_0}{C_t}$$

$$\text{Wilhemly formula : } C_t = C_0 e^{-kt}$$

$$\text{Interval formula : } k = \frac{2.303}{(t_2 - t_1)} \log \frac{C_1}{C_2}$$

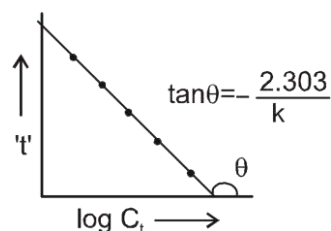

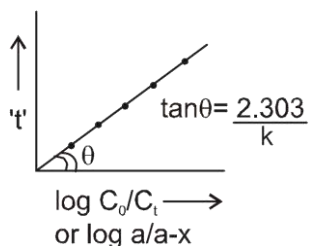

$$\text{Half life time (} t_{1/2} \text{) } k = \frac{2.303}{t_{1/2}} \log \frac{2C_0}{C_0} \Rightarrow t_{1/2} = \frac{2.303 \log 2}{k} = \frac{\ln 2}{k} = \frac{0.693}{k}$$

∴ Half life period for a 1st order reaction is a constant quantity.

Graphical Representation:

$$t = -\frac{2.303}{k} \log C_t + \frac{2.303}{k} \log C_0$$

First order growth reaction:

For bacteria multiplication or virus growth use following concept Consider a growth reaction

Time Population (or colony)

0 a

t (a + x)

$$\frac{dx}{dt} = k(a + x) \text{ or } \frac{dx}{(a+x)} = k dt$$

on integration

$$\log_e (a + x) = kt + C \text{ at } t = 0; x = 0 \Rightarrow C = \log_e a$$

$$kt = -\log_e \frac{a}{(a+x)} = -2.303 \log_{10} \left(\frac{a}{(a+x)} \right)$$

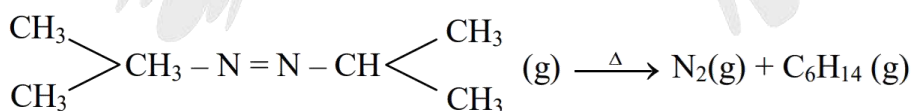

$$k = \frac{2.303}{t} \log_{10} \left(\frac{a+x}{a} \right)$$

Generation time:

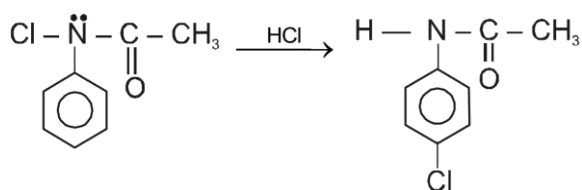

$$\text{At } t = \text{generation time, } x = a \therefore t = \frac{0.693}{K}$$

Examples of 1st order reactions:

1. Decomposition of azoisopropane

2. Conversion of N-chloro acetanilide into p-chloroacetanilide

5. Radioactive decay

All radioactive decays are always first order kinetics.

Ex.8 Calculate $\frac{t_{0.75}}{t_{0.50}}$ for a 1st order reaction :

Sol. $k = \frac{2.303}{t_{3/4}} \log \frac{C_0}{\frac{1}{4}C_0} = \frac{2.303}{t_{1/2}} \log \Rightarrow \frac{t_{3/4}}{t_{1/2}} = \frac{\log 4}{\log 2} = \frac{2 \log 2}{\log 2} = 2$

Ex.9 Gaseous cyclobutane isomerizes to butadiene in a first order process which has

$k = 3.3 \times 10^{-4} \text{ s}^{-1}$ at 153°C . How many minutes would it take for the isomerization to proceed 40% completion at this temperature.

Sol. For the First order Rxn

$$t = \frac{2.303}{K} \log \frac{a}{(a-x)} \quad t = \frac{2.303}{3.3 \times 10^{-4}} \log \left(\frac{100}{60} \right)$$

$$t = 1.54 \times 10^3 \text{ Second.} \quad = 25.80 \text{ Minute}$$

4.3 Second order reaction:

2nd order Reactions

Two types

a a

$$\therefore \frac{dx}{dt} = k(a-x)^2$$

$$\Rightarrow \int_0^x \frac{dx}{(a-x)^2} = \int k dt$$

$$\Rightarrow \left(\frac{1}{(a-x)} \right)_0^x = kt$$

$$\Rightarrow \frac{1}{(a-x)} - \frac{1}{a} = kt \text{ or } \frac{1}{C_t} - \frac{1}{C_0} = kt$$

a

Rate law

$$\frac{dx}{dt} = k(a-x)(b-x)$$

$$\int_0^x \frac{dx}{(a-x)(b-x)} = \int_0^t k dt$$

$$K = \frac{2.303}{t(b-a)} \log \frac{a(b-x)}{b(a-x)}$$

4.4 Pseudo first order reaction:

A second order (or of higher order) reactions can be converted into a first order reaction if the other reactant is taken in large excess. Such first order reactions are known as pseudo first order reactions.

\therefore For $A + B \rightarrow \text{Products}$ [Rate = $K[A]^1[B]^1$]

$$k = \frac{2.303}{t(a-b)} \log \frac{b(a-x)}{a(b-x)}$$

Now if 'B' is taken in large excess $b \gg a$.

$$\therefore k = \frac{2.303}{-bt} \log \frac{(a-x)}{a} \Rightarrow k \frac{2.303}{bt} = \log \frac{a}{a-x}$$

\therefore 'b' is very large can be taken as constant

$$\Rightarrow kb = \frac{2.303}{t} \log \frac{a}{a-x} \Rightarrow k' = \frac{2.303}{t} \log \frac{a}{a-x}$$

k' is pseudo first order rate constant

K' will have units of first order

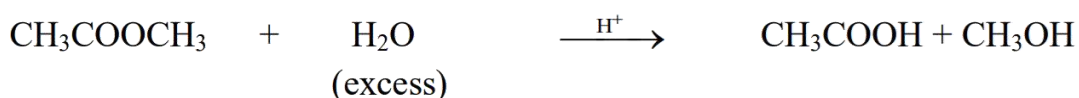

K will have units of second order.

Examples of Pseudo 1st order reactions:

(a) Hydrolysis of canesugar:

(b) Hydrolysis of esters:

Ex.10 Hydrolysis of methyl acetate in aqueous solution has been studied by titrating the liberated acetic acid against sodium hydroxide. The concentration of the ester at different times is given below:

t/min	0	30	60	90
c/M	0.8500	0.8004	0.7538	0.7096.

Show that it follows a pseudo first order reaction as the concentration of H_2O remains nearly constant (51.2M) during the course of the reaction. What is the value of k in the equation?

$$\text{rate} = k[\text{CH}_3\text{COOCH}_3][\text{H}_2\text{O}]$$

Sol. For pseudo first order reaction, the reaction should be first order with respect to the ester when $[\text{H}_2\text{O}] = \text{constant}$. From the above data we note

t	c	$k[\text{H}_2\text{O}] = \text{min}^{-1}$
0	0.8500	—
30	0.8004	2.004×10^{-3}
60	0.7538	2.002×10^{-3}
90	0.7096	2.005×10^{-3}

It can be seen that $k[\text{H}_2\text{O}]$ is constant and equal to $2.004 \times 10^{-3} \text{ min}^{-1}$ and hence it is pseudo first order reaction. We can now determine k from

$$k[\text{H}_2\text{O}] = 2.004 \times 10^{-3} \text{ min}^{-1}$$

$$k[51.2\text{M}] = 2.004 \times 10^{-3} \text{ min}^{-1}$$

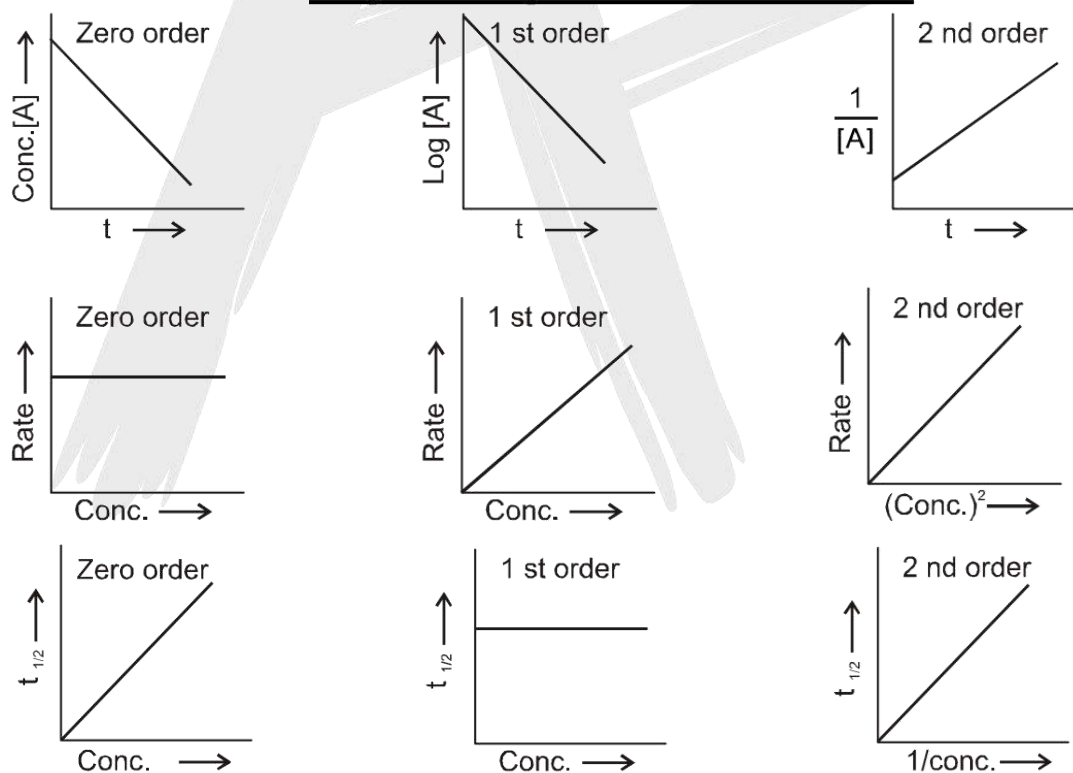

$$k = 3.914 \times 10^{-5} \text{ M}^{-1} \text{ min}^{-1}$$

It has the units of a second order reaction.

Table : Characteristics of Zero, First, Second and n^{th} Order Reactions of the Type A Products

	Zero Order	First-Order	Second-Order	n^{th} order
Differential Rate law	$\frac{-d[A]}{dt} = k[A]^0$	$\frac{-d[A]}{dt} = k[A]$	$\frac{-d[A]}{dt} = k[A]^2$	$\frac{-d[A]}{dt} = k[A]^n$
(Integrated Rate law)	$[A]_t = [A]_0 - kt$	$\ln[A]_t = -kt + \ln[A]_0$	$\frac{1}{[A]_t} = kt + \frac{1}{[A]_0}$	$\frac{1}{(A_t)^{n-1}} - \frac{1}{(A_0)^{n-1}} = (n-1)kt$
Linear graph	$[A]_t$ v/s t	$\ln[A]$ v/s t	$\frac{1}{[A]}$ v/s t	$\frac{1}{(A_t)^{n-1}}$ v/s t
Half-life	$t_{1/2} = \frac{[A]_0}{2k}$ (depends on $[A]_0$)	$t_{1/2} = \frac{0.693}{k}$ (independent of $[A]_0$)	$t_{1/2} = \frac{1}{k[A]_0}$ (depends on $[A]_0$)	$t_{1/2} \propto \frac{1}{(A_0)^{n-1}}$
Unit	$\text{mol L}^{-1} \text{s}^{-1}$	s^{-1}	$\text{mol}^{-1} \text{L s}^{-1}$	$\frac{(\text{Conc.})^{1-n}}{t}$

Graphical comparison of different orders

DO YOURSELF-2

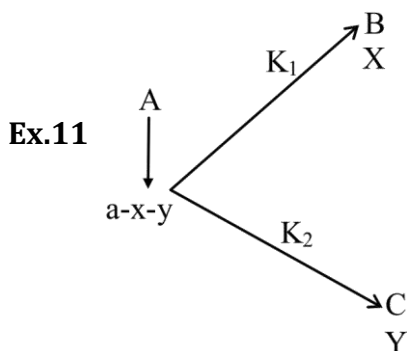

- Calculate $\frac{t_{0.5}}{t_{0.25}}$ for a 1st order reaction
- At least how many half-lives should elapse for a 1st order reaction $A \rightarrow \text{products}$ so that the reaction is at least 95% completed? ($\log 2 = 0.3$)
(A) 4 (B) 5 (C) 6 (D) 7
- In the biological processes, the time taken by certain virus or bacteria to double its population, is called generation time. In milk, at 37°C, lactobacillus acidophilus has a generation time of about 75 min. Calculate the population relative to the initial value at 60 min.
- A and B are two different chemical species undergoing 1st order decomposition with half lives equal to 5sec. and 7.5sec. respectively. If the initial concentration of A and B are in the ratio 3: 2. Calculate $\frac{C_{A_t}}{C_{B_t}}$ after three half lives of A. Report your answer after multiplying it with 100.
- What will be the order of reaction and rate constant for a chemical change having $\log t_{50\%}$ vs $\log a$ curves as:

- (A) 0, 1/2 (B) 1, 1 (C) 2, 2 (D) 3, 1
- For a reaction $2A + B \rightarrow \text{product}$, rate law is $-\frac{d[A]}{dt} = k[A]$. At a time when $t = \frac{1}{k}$, concentration of the reactant is : (C_0 = initial concentration)
(A) $\frac{C_0}{e}$ (B) $C_0 e$ (C) $\frac{C_0}{e^2}$ (D) $\frac{1}{C_0}$

5. COMPLICATIONS IN 1st ORDER REACTION

5.1 PARALLEL 1st ORDER REACTION

$$t = 0 \quad [A] = a; [B] = [C] = 0$$

Calculate effective $t_{1/2}$ for [A], concentration of [B] & [B]/[C].

Sol. $\frac{d[B]}{dt} = K_1[A] \quad \frac{d[C]}{dt} = K_2[A]$

$$\frac{-d[A]}{dt} = \frac{d[B]}{dt} + \frac{d[C]}{dt}$$

$$\frac{-d[A]}{dt} = (K_1 + K_2)[A] = K_{\text{eff}}[A]$$

$$K_{\text{eff}} = K_1 + K_2$$

$$\frac{\ln 2}{T_{\text{eff}}} = \frac{\ln 2}{T_1} + \frac{\ln 2}{T_2} \quad (\text{Where } T \text{ represent half life})$$

$$\frac{1}{T_{\text{eff}}} = \frac{1}{T_1} + \frac{1}{T_2} \quad (\text{remember})$$

$$\text{Now, } [A]_t = ae^{-K_{\text{eff}}t} = ae^{-(K_1+K_2)t}$$

$$\frac{d[B]}{dt} = K_1[A]$$

$$\frac{d[B]}{dt} = K_1ae^{-(K_1+K_2)t}$$

$$[B] = \left(\frac{k_1 a}{k_1 + k_2} \right) (1 - e^{-(K_1+K_2)t}) \quad [\text{remember}]$$

similarly

$$[C] = \frac{K_2 a}{K_1 + K_2} (1 - e^{-(k_1+k_2)t})$$

$$\frac{[B]}{[C]} = \frac{K_1}{K_2} \quad (\text{remember})$$

$$K_{\text{eff}} = k_1 + k_2$$

$$A_{\text{eff}} e^{-E_a/RT} = A_1 e^{-E_{a1}/RT} + A_2 e^{-E_{a2}/RT}$$

On differentiating

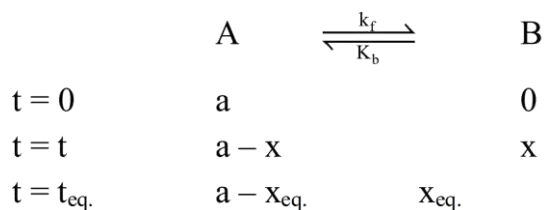

$$-\frac{E_a}{RT} \cdot A_{\text{eff}} \cdot e^{-E_a/RT} = -\frac{E_{a1}}{RT} (A_1 e^{-E_{a1}/RT}) - \frac{E_{a2}}{RT} (A_2 e^{-E_{a2}/RT})$$

$$-\frac{E_a}{RT} \times K_{\text{eff}} = \frac{E_{a1}}{RT} K_1 - \frac{E_{a2}}{RT} K_2$$

$$E_a = \frac{E_{a1} + k_1 + E_{a2} k_2}{k_1 + k_2}$$

REVERSIBLE 1ST ORDER REACTION (both forward and backward)

Ex.12

$x_{eq.}$ = eq conc. of product

$$\frac{d[A]}{dt} = \frac{d[B]}{dt} = 0 \text{ At eq.}$$

(\because At equilibrium conc. is not changed)

$$\frac{d[A]}{dt} = -K_f[A] + K_b[B]$$

$$\frac{d[B]}{dt} = -K_b[B] + k_f[A]$$

$$\frac{d(a-x)}{dt} = -K_f(a-x) + K_b x$$

$$-\frac{dx}{dt} = -K_f a + (K_f + K_b)x$$

$$\int_0^x \frac{dx}{K_f a - (K_f + K_b)x} = \int_0^t dt$$

$$-\frac{\ln [K_f a - (K_f + K_b)x]_0^x}{K_f + K_b} = t$$

$$\Rightarrow \frac{1}{K_f + K_b} \left(-\ln \left(\frac{K_f a - (K_f + K_b)x}{K_f a} \right) \right) = t$$

$$\Rightarrow \frac{1}{K_f + K_b} \ln \left(\frac{K_f a}{K_f a - (K_f + K_b)x} \right) = t$$

$$x = \frac{K_f a}{K_f + K_b} (1 - e^{-(K_f + K_b)t}) \text{ (remember)}$$

$$K_{eq.} = \frac{K_f}{K_b} = \frac{[B]_{eq.}}{[A]_{eq.}} = \frac{x_{eq.}}{(a - x_{eq.})}$$

$$\frac{K_f + K_b}{K_f} = \frac{a}{x_{eq.}}$$

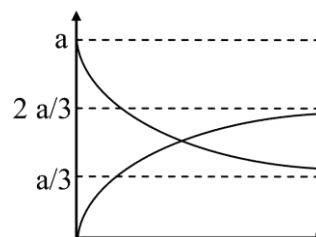

$$x = x_{eq.} (1 - e^{-(K_f + K_b)t}) (t \rightarrow \infty, x \rightarrow x_{eq.})$$

$$K_f + K_b = \frac{1}{t} \ln \left(\frac{x_{eq.}}{x_{eq.} - x} \right) \text{ (remember)}$$

Where $x_{eq.} = a \times \left[\frac{K_f}{K_f + K_b} \right]$

$$x_{eq.} = \frac{K_f \times a}{K_f + K_b}$$

if $\frac{K_f}{K_b} = 2$

5.2 SEQUENTIAL 1ST ORDER REACTION

Ex. 13 $A \xrightarrow{K_1} B \xrightarrow{K_2} C$ all first order equation

$$\begin{array}{cccc} t = 0 & a & 0 & 0 \\ t & a - x & y & z \\ \text{Calculate} & [A]_t & [B]_t \& [C]_t \end{array}$$

Sol. For $\rightarrow A$

$$\frac{-d[A]}{dt} = r_1 = K_1[A]$$

$$\frac{-d[A]}{[A]} = K_1 dt$$

$$[A]_t = [A]_0 e^{-K_1 t}$$

$$a - x = a e^{-K_1 t}$$

$$x = a(1 - e^{-K_1 t})$$

Ex.14 Calculate time at which concentration of B will be maximum

$$\frac{dy}{dt} = 0$$

$$-K_1 e^{-K_1 t} + K_2 e^{-K_2 t} = 0$$

$$e^{-K_2 t} = \frac{K_1}{K_2} e^{-K_1 t}$$

$$e^{K_1 t} = \frac{K_1}{K_2} e^{K_2 t}$$

$$K_1 t = \ln \frac{K_1}{K_2} + K_2 t$$

$$t_{\max} = \frac{1}{(K_1 - K_2)} \ln \frac{K_1}{K_2} \text{ (remember)}$$

$$[B]_{\max} = a \times \left[\frac{K_2}{K_1} \right]^{\frac{K_2}{K_1 - K_2}} = [A_0] \left[\frac{K_2}{K_1} \right]^{\frac{K_2}{K_1 - K_2}}$$

CASE-I

$$K_1 \gg K_2$$

$$\downarrow a - x$$

$$[A] = a e^{-K_1 t}$$

(conc. is minimum)

$$[B] = a e^{-K_2 t}$$

$$[C] = a(1 - e^{-K_2 t})$$

$$\therefore K_1 t \gg K_2 t$$

$$\therefore K_1 > K_2$$

$$\therefore K_1 t \ll -K_2 t$$

$$\therefore e^{-K_1 t} < e^{-K_2 t}$$

$$y = \frac{K_1 a}{K_1} (-e^{-K_1 t}) = a e^{-K_2 t} = [B]$$

effective half life is $t_{1/2}$ for B.

CASE-I

$$K_2 \gg K_1$$

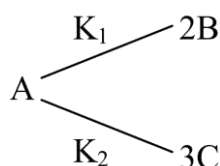

$$[B]_t \rightarrow 0$$

$$[A] = ae^{-k_1 t}$$

$$[C] = a(1 - e^{-k_1 t})$$

$$y = \frac{K_1}{K_2} ae^{-K_1 t} = \frac{K_1}{K_2} [A] \left(\frac{K_1}{K_2} \rightarrow 0 \right)$$

Ex-15 For a first order reaction

Percentage of B in the product is 30%. Calculate the value of

$$k_1 \text{ and } k_2. \left((t_{1/2})_{\text{over all}} = 100\text{hr} \right)$$

Ans. $k_1 = \frac{9 \ln 2}{2300}; k_2 = \frac{14}{2300} \ln 2$

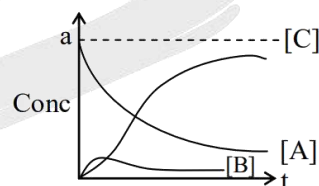

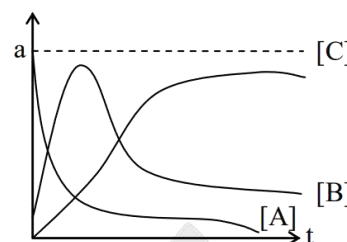

Sol. $\frac{[B]}{[C]} = \frac{2k_1}{3k_2} \Rightarrow \frac{0.3}{0.7} = \frac{2k_1}{3k_2}$

$$\Rightarrow \frac{k_1}{k_2} = \frac{9}{14} \Rightarrow k_2 = \frac{14}{9} k_1$$

$$k_{\text{eff}} = k_1 + k_2 = k_1 + \frac{14}{9} k_1$$

$$\Rightarrow \frac{\ln 2}{100} = \frac{23}{9} k_1 \Rightarrow k_1 = \frac{9}{2300} \ln 2$$

$$k_2 = \frac{14}{2300} \ln 2.$$

6. Methods to determine order of a reaction :

6.1 Initial rate method :

By comparison of different initial rates of a reaction by varying the concentration of one of the reactants while others are kept constant

$$r = k[A]^a[B]^b[C]^c \text{ if } [B] = \text{constant}$$

$$[C] = \text{constant}$$

then for two different initial concentrations of A we have

$$r_{01} = k[A_0]_1^a$$

$$r_{02} = k[A_0]_2^a$$

$$\Rightarrow \frac{r_{01}}{r_{02}} = \left(\frac{[A_0]_1}{[A_0]_2} \right)^a$$

or in log form we have $a = \frac{\log(r_{01}/r_{02})}{\log([A_0]_1/[A_0]_2)}$

Ex.16 For the reaction $A + B \rightarrow \text{products}$ the following data were obtained :

Initial rate (mole/liter.sec)	0.030	0.059	0.060	0.090	0.089
[A] (mole/liter)	0.10	0.20	0.20	0.30	0.30
[B] (mole/liter)	0.20	0.20	0.30	0.30	0.50

Write the rate equation for this reaction. Be sure to evaluate k.

Sol. Rate = $K[A]^x [B]^y$

From data I. $0.030 = K [0.10]^x [0.20]^y$ (1)

From data II. $0.059 = K [0.20]^x [0.20]^y$ (2)

From III. $0.060 = K [0.20]^x [0.30]^y$ (3)

divide 1 equation by (2)

$$\frac{0.030}{0.059} = \frac{K[0.10]^x [0.20]^y}{K[0.20]^x [0.20]^y}$$

$$\Rightarrow x = 1$$

Then divide (2) equation by (3)

$$\frac{0.059}{0.060} = \frac{K[0.20]^x [0.20]^y}{K[0.20]^x [0.30]^y}$$

$$\Rightarrow y = 0$$

Put the value of x and y in (1) equation

$$0.030 = K[0.10]^1 [0.20]^0$$

$$K = \frac{0.030}{0.10} = 0.3 \text{ Sec}^{-1}$$

6.2 Integrated rate law method:

It is method of hit and trial. By checking where the kinetic data (experimental data) best fits into which integrated rate law, we determine the order. It can also be done graphically.

Ex.17 The rate of decomposition of N_2O_5 in CCl_4 solution has been studied at 318 K and the following results have been obtained :

t/min	0	135	342	683	1693
c/M	2.08	1.91	1.67	1.35	0.57

Find the order of the reaction and calculate its rate constant. What is the half-life period?

Sol. It can be shown that these data will not satisfy the integrated rate law of zero order. We

now try integrated first order equation i.e., $k = \frac{\ln(c_0/c)}{t}$

t/min	c/M	$k = \frac{\ln(c_0/c)}{t} \text{ min}^{-1}$
0	2.08	6.32×10^{-4}
135	1.91	6.30×10^{-4}
342	1.67	6.32×10^{-4}
683	1.35	6.32×10^{-4}
1693	0.57	6.31×10^{-4}

It can be seen that the value of k is almost constant for all the experimental results and hence it is first order reaction with $k = 6.31 \times 10^{-4} \text{ min}^{-1}$.

$$t_{1/2} = \frac{0.693}{6.31 \times 10^{-4} \text{ min}^{-1}} = 1.094 \times 10^3 \text{ min}^{-1}$$

Graphical method: Alternatively, if we draw a graph between $\ln c$ against t , we obtain a straight line with slope $= -k$.

6.3 Method of half lives:

- The half lives of each order is unique so by comparing half lives we can determine order

$$\text{for } n^{\text{th}} \text{ order reaction } t_{1/2} \propto \frac{1}{[C_0]^{n-1}} \Rightarrow \frac{t_{1/2}}{t'_{1/2}} = \frac{(C'_0)^{n-1}}{(C_0)^{n-1}}$$

Ex.18 In the reduction of nitric gas with hydrogen, the reaction was found to be 50% complete in 210 seconds when the initial pressure of the mixture was 200 mm. In a second experiment the time of half reaction was 140 seconds when the initial pressure was 300 mm. Calculate the total order of the reaction.

Sol. For a n^{th} order reaction ($n \neq 1$), $t_{1/2} \propto \frac{1}{c_0^{n-1}}$

$$\frac{210}{140} = \left(\frac{300}{200}\right)^{n-1} \quad n = 2$$

7. Methods to monitor the progress of the reaction :

7.1 Pressure measurement :

Progress of gaseous reaction can be monitored by measuring total pressure at a fixed volume & temperature.

This method can be applied for those reactions also in which a gas is produced because of decomposition of a solid or liquid. We can get an idea about the concentration of reacting species at a particular time by measuring pressure.

The pressure data can be given in terms of

- Partial pressure of the reactant
- Total pressure of the reaction system

Ex.19 Find the expression for K in terms of P_0 , P_t and n

Sol. Let there is a 1^{st} order reaction

Let initial pressure at time t P_0 $0 \leq t < \infty$

$$P_A = (P_0 - x) \times n$$

$$\therefore P_t \text{ (Total pressure at time 't')} = P_0 - x + nx = P_0 + (n-1)x$$

$$\therefore x = \frac{P_t - P_0}{n-1}$$

$$\therefore P_A = P_0 - \frac{P_t - P_0}{n-1} = \frac{P_0 n - P_t}{n-1}$$

$$\therefore a \propto p_0 \text{ \& } a - x \propto P_A = \frac{nP_0 - P_t}{n-1}$$

$$\therefore k = \frac{2.303}{t} \log \frac{P_0(n-1)}{nP_0 - P_t}$$

Final total pressure after infinite time $= P_f = nP_0$

- Formula is not applicable when $n = 1$, the value of n can be fractional also.
- Do not remember the formula but derive it for each question.

7.2 Volume measurement:

(i) By measuring the volume of product formed we can monitor the progress of reactions.

Ex.20 Study of a reaction whose progress is monitored by measuring the volume of an escaping gas.

Sol. Let, V_t be the volume of N_2 collected at time 't' V_∞ = be the volume of N_2 , collected at the end of the reaction.

$$a \propto V_\infty \text{ and } x \propto V_t$$

$$(a - x) \propto V_\infty - V_t$$

$$\therefore k = \frac{2.303}{t} \log \frac{V_\infty}{V_\infty - V_t}$$

(ii) By titration method :

By measuring the volume of titrating agent we can monitor amount of reactant remaining or amount of product formed at any time. It is the titre value. Here the milliequivalent or millimoles are calculated using valence factors.

Ex.21 From the following data show that the decomposition of hydrogen peroxide in aqueous solution is a first - order reaction. What is the value of the rate constant?

Time in minutes	0	10	20	30	40
Volume V in ml	25.0	20.0	15.7	12.5	9.6

where V is the number of ml of potassium permanganate required to react with a definite volume of hydrogen peroxide solution.

Sol. The equation for a first order reaction is

the volume of KMnO_4 used, evidently corresponds to the undecomposed hydrogen peroxide. Hence the volume of KMnO_4 used, at zero time corresponds to the initial concentration a and the volume used after time t , corresponds to $(a - x)$ at that time. Inserting these values in the above equation, we get

$$\text{When } t = 10 \text{ min. } k_1 = \frac{2.303}{10} \log \frac{25}{20.0} = 0.022318 \text{ min}^{-1} = 0.000372 \text{ s}^{-1}$$

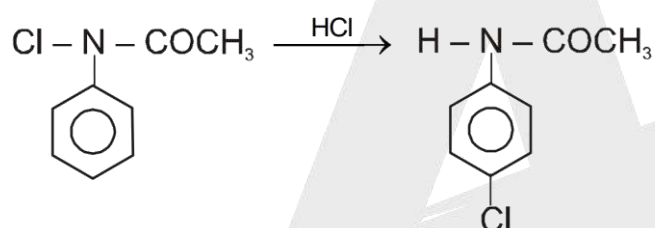

$$\text{when } t = 20 \text{ min. } k_1 = \frac{2.303}{20} \log \frac{25}{15.7} = 0.023265 \text{ min}^{-1} = 0.000387 \text{ s}^{-1}$$

$$\text{when } t = 30 \text{ min. } k_1 = \frac{2.303}{30} \log \frac{25}{12.5} = 0.02311 \text{ min}^{-1} = 0.000385 \text{ s}^{-1}$$

$$\text{when } t = 40 \text{ min. } k_1 = \frac{2.303}{40} \log \frac{25}{9.6} = 0.023932 \text{ min}^{-1} = 0.0003983 \text{ s}^{-1}$$

The constancy of k , shows that the decomposition of H_2O_2 in aqueous solution is a first order reaction. The average value of the rate constant is 0.0003879 s^{-1} .

Ex.22 Conversion of N-chloro acetanilide into p-chloroacetanilide

The above reaction is first order reaction and its progress is monitored by iodometric titration in which liberated iodine is titrated against a standard solution of Hypo using starch as indicator. Given that in this reaction KI does not react with the product (p-chloro acetanilide). Calculate the rate constant of the reaction. Given that volume of hypo consumed at $t = 0$ is V_0 and at time ' t ', V_t

Sol. Let, V_0 = volume of hypo consumed at $t = 0$
 Similarly V_t = volume of hypo consumed at $t = 't'$
 $\therefore a \propto V_0 \{ \because \text{KI reacts with the reactant only} \}$

$$a - x \propto V_t$$

$$k = \frac{2.303}{t} \log \frac{V_0}{V_t}$$

Ex.23 Study of acid hydrolysis of an ester.

The progress of this reaction is monitored or determined by titrating the reaction mixture at different time intervals against a standard solution of NaOH using phenolphthalein as indicator. Find out rate constant of the reaction in terms of volume of NaOH consumed at $t = 0$, V_0 , at $t = \infty$, V_∞ & at time t , V_t .

Sol. Let, V_0 = vol. of NaOH used at $t = 0$
 [this is exclusively for HCl.]

V_t = vol. of NaOH used at 't'

V_∞ = vol. of NaOH used at $t = \infty$

$$a \propto V_\infty - V_0$$

$$a - x \propto V_\infty - V_t$$

$$x \propto V_t - V_0$$

$$a \propto V_\infty - V_0 ; k = \frac{2.303}{t} \log \frac{V_\infty - V_0}{V_\infty - V_t}$$

7.3 Optical rotation measurement:

It is used for optically active sample. It is applicable if there is at least one optically active species involved in chemical reaction.

The optically active species may be present in reactant or product.

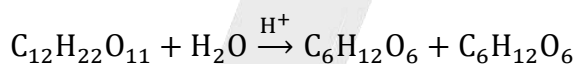

$$(r_\infty - r_0) \propto a$$

It is found that $(r_\infty - r_t) \propto (a - x)$

(a = initial concentration, x = amount consumed)

where r_0, r_t, r_∞ are angle of optical rotation at time $t = 0, t = t$ and $t = \infty$

Ex.24 Study of hydrolysis of sucrose progress of this reaction is monitored with the help of polarimeter because a solution of sucrose is dextrorotatory and on hydrolysis, the mixture of glucose as fructose obtained becomes laevorotatory. That's why this reaction is also known as inversion of cane sugar.

excess glucose fructose

$$\text{Sp. rotation } +66.5^\circ + 52.7^\circ - 92.4^\circ$$

Let the readings in the polarimeter are

$t = 0, \theta_0; t = t', \theta_t$ and at $t = \infty, \theta_\infty$

Then calculate rate constant 'k' in terms of these readings.

Sol. The principle of the experiment is that change in the rotation is directly proportional to the amount of sugar hydrolysed.

$$\therefore a \propto \theta_0 - \theta_\infty; a - x \propto \theta_t - \theta_\infty$$

$$k = \frac{2.303}{t} \log \left(\frac{\theta_0 - \theta_\infty}{\theta_t - \theta_\infty} \right)$$

Ex.25 Decomposition of H_2O_2 .

The progress of this reaction is measured by titrating the reaction mixture with $KMnO_4$ at different time intervals. Calculate rate constant of the reaction in terms of volume of $KMnO_4$

consumed at time $t = 0$, V_0 and at time t , V_t .

Sol. Assume the decomposition of H_2O_2 is a first order reaction

$KMnO_4$ React Only with the H_2O_2 them

$$\text{For 1st order reaction } K = \frac{2.303}{t} \log \frac{a}{(a-x)}$$

Then $a \propto V_0$

and $(a - x) \propto V_t$

$$\text{Then } K = \frac{2.303}{t} \log \left(\frac{V_0}{V_t} \right)$$

Ex.26 $A \xrightarrow{D} B + C$

Time	0	t	∞
Volume of reagent	V_1	V_2	V_3

The reagent reacts with only B, C and D. Find k.

Sol. $A \xrightarrow{D} B + C$

at $t = 0$	a	0	0
$t = t$	$(a - x)$	x	x
$t = \infty$	0	a	a

at $t = 0$ only D. React

after $t = 0$ reagent react with B.C.D.

$$2a \propto (V_3 - V_1)$$

$$a \propto \frac{(V_3 - V_1)}{2}$$

$$2x \propto (V_2 - V_1)$$

$$2(a - x) \propto (V_3 - V_1 - V_2 + V_1)$$

$$(a - x) \propto \frac{(V_3 - V_2)}{2}$$

$$\text{Then } K = \frac{1}{t} \ln \frac{(V_3 - V_1)}{(V_3 - V_2)}$$

Ex.27 $A \rightarrow B + C$

Time	0	t
Volume of reagent	V_1	V_2

The reagent reacts with A, B and C. Find k.

Sol.

$$\begin{aligned}
 &A \rightarrow B + C \\
 t = 0 & \quad a \quad 0 \quad 0 \\
 t = t & \quad (a-x) \quad x \quad x \\
 & a \propto V_1 \\
 & (a-x) + x + x \propto V_2 \\
 & (a+x) \propto V_2 \\
 & (a-x) \propto (2V_1 - V_2); K = \frac{1}{t} \ln \frac{[A]_0}{[A]_t} = \frac{1}{t} \ln \frac{V_1}{(2V_1 - V_2)}
 \end{aligned}$$

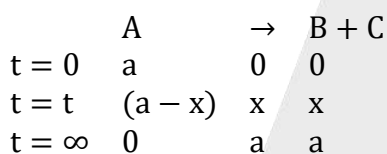

Ex.28 $A \rightarrow B + C$

Time	T	∞
Volume of reagent	V_2	V_3

Reagent reacts with all A, B and C and have 'n' factors in the ratio of 1: 2: 3 with the reagent.

Find k.

Sol.

Reagent React with all A, B, C. and have 'n' factor in the Ratio 1: 2: 3

$$(2a + 3a) \propto V_3$$

$$a \propto \frac{V_3}{5}$$

$$(a-x) \times 1 + 2x + 3x \propto V_2$$

$$(a + 4x) \propto V_2$$

$$\frac{V_3}{5} + 4x \propto V_2$$

$$x \propto \frac{1}{4} \left(V_2 - \frac{V_3}{5} \right)$$

$$\Rightarrow (a-x) \propto \frac{V_3}{5} - \frac{1}{4} \left(V_2 - \frac{V_3}{5} \right)$$

$$(a-x) \propto \frac{5(V_3 - V_2)}{20}$$

$$\Rightarrow K = \frac{1}{t} \ln \frac{4V_3}{5(V_3 - V_2)}$$

Ex.29 The hydrolysis of cane sugar was studied using an optical polarimeter and the following readings were taken.

time (min.):	0	84 min	∞
observed rotation :	50	20	-10
(degrees)			

When will the mixture optically inactive? ($\log 2 = 0.3, \log 3 = 0.48$)

Sol. From the hydrolysis

$$K = \frac{2.303}{t} \log \frac{(r_0 - r_\infty)}{r_t - r_\infty} = \frac{2.303}{84} \log \frac{50+10}{20+10}$$

$$K = \frac{2.303}{84} \times 0.3010 = 8.252 \times 10^{-3}$$

The time taken when sample are optically Inactive is t

$$K = \frac{2.303 \times 0.3010}{84} = \frac{2.303}{t} \log \frac{50+10}{+10}$$

$$t = 217.14 \text{ minute}$$

DO YOURSELF-3

- The rate constant for two parallel reactions were found to be $1.0 \times 10^{-2} \text{ dm}^3 \text{ mol}^{-1} \text{ s}^{-1}$ and $3.0 \times 10^{-2} \text{ dm}^3 \text{ mol}^{-1} \text{ s}^{-1}$. If the corresponding energies of activation of the parallel reactions are 60.0 kJ mol^{-1} and 70.0 kJ mol^{-1} respectively, what is the apparent overall energy of activation?
(A) $130.0 \text{ kJ mol}^{-1}$ (B) 67.5 kJ mol^{-1} (C) $100.0 \text{ kJ mol}^{-1}$ (D) 65.0 kJ mol^{-1}
- The data for the reaction $A + B \rightarrow C$ is

Exp.	$[A]_0$	$[B]_0$	initial rate
1	0.012	0.035	0.10

6.25	10
9.00	15
11.40	20
13.65	25
35.05	Infinity

The order of the reaction is

- The optical rotation of sucrose in 0.5M HCl at 35°C at various time intervals are given below.

Show that the reaction is first order.

Time (minutes)	0	10	20	30	40	∞
Rotation (degrees)	+32.4	+28.8	+25.5	+22.4	+19.6	-11.1

5. The decomposition of N_2O_5 in chloroform was followed by measuring the volume of O_2 gas evolved : $2 \text{N}_2\text{O}_5(\text{CCl}_4) \rightarrow 2 \text{N}_2\text{O}_4(\text{CCl}_4) + \text{O}_2(\text{g})$. The maximum volume of O_2 gas obtained was 100 cm^3 . In 500 minutes, 90 cm^3 of O_2 were evolved. The first order rate constant (in min^{-1}) for the disappearance of N_2O_5 is :

(A) $\frac{2.303}{500}$ (B) $\frac{2.303}{500} \log \frac{100}{90}$ (C) $\frac{2.303}{500} \log \frac{90}{100}$ (D) $\frac{100}{10 \times 500}$

Ex.30 Now, let us assume that A, B and C are optically active compounds, which rotate the plane polarized light in the clockwise or anticlockwise direction.

Time	T	T	∞
Total rotation in degrees	r_0	r_1	r_∞

Calculate the expression of rate constant.

Sol. The principle of the experiment is that change in the rotation is directly proportional to concentration.

$$a\alpha(r_0 - r_\infty)$$

$$(a - x)\alpha(r_t - r_\infty)$$

Then Expression For rate constant

$$K = \frac{2.303}{t} \log \frac{r_0 - r_\infty}{r_t - r_\infty}$$

8. Effect of temperature on rate of reaction :

In early days the effect of temperature on reaction rate was expressed in terms of temperature coefficient which was defined as the ratio of rate of reaction at two different temperature differing by 10°C (usually these temperatures were taken as 25°C and 35°C)

$$\text{T.C.} = \frac{K_{t+10}}{K_t} \approx 2 \text{ to } 3 \text{ (for most of the reactions)}$$

Ex.31 For a reaction $\text{T.C.} = 2$, Calculate $\frac{k_{40^\circ\text{C}}}{k_{25^\circ\text{C}}}$ for this reaction.

Sol. $\frac{k_2}{k_1} = (\text{T.C.})^{\frac{\Delta t}{10}} = (2)^{\frac{15}{10}} = (2)^{\frac{3}{2}} = \sqrt{8}$

But the method of temperature coefficient was not exact and to explain the effect of temperature on reaction rate new theory was evolved

9. Arrhenius theory of reaction rate :

It was developed by Max Trautz and William Lewis.

It gives insight in to the energetics and mechanistic aspects of reactions.

It is based upon kinetic theory of gases.

Arrhenius proposed a theory of reaction rate which states as follows :

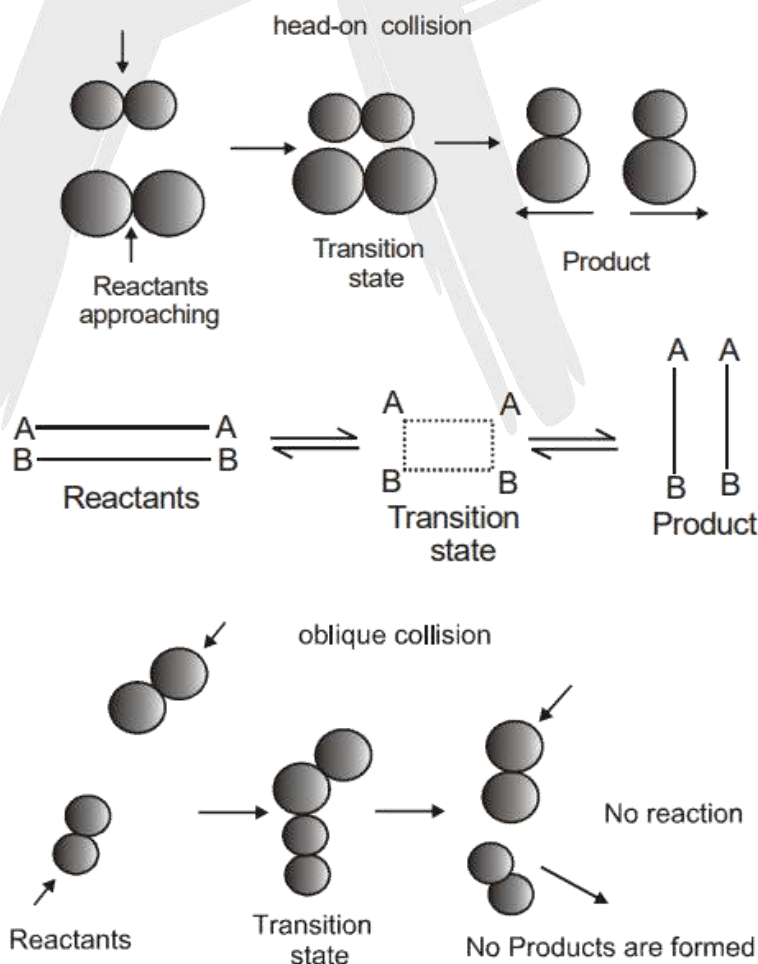

A chemical reaction takes place due to the collision among reactant molecules. The number of collisions taking place per second per unit volume of the reaction mixture is known as collision frequency (Z).

Every collision does not bring a chemical change. The collision that actually produce the products are effective collision. For a collision to be effective the following two barriers are to be cleared.

Energy barrier

The minimum amount of energy which the colliding molecules must possess as to make the chemical reaction to occur is known as threshold energy. "The minimum amount of energy required by reactant molecules to participate in a reaction is called activation energy (E_a) "

Orientation barrier: Energy alone does not determine the effectiveness of the collision. The reacting molecules must collide in proper direction to make collision effective. Following diagrams can explain importance of suitable direction for collision.

Collision to be effective the colliding molecules must possess some certain minimum energy called threshold energy of the reaction.

Reactant molecules having energy equal or greater than the threshold are called active molecules and those having energy less than the threshold are called passive molecules. At a given temperature there exists a dynamic equilibrium between active and passive molecules. The process of transformation from passive to active molecules being endothermic, increase of temperature increases the number of active molecules and hence the reaction.

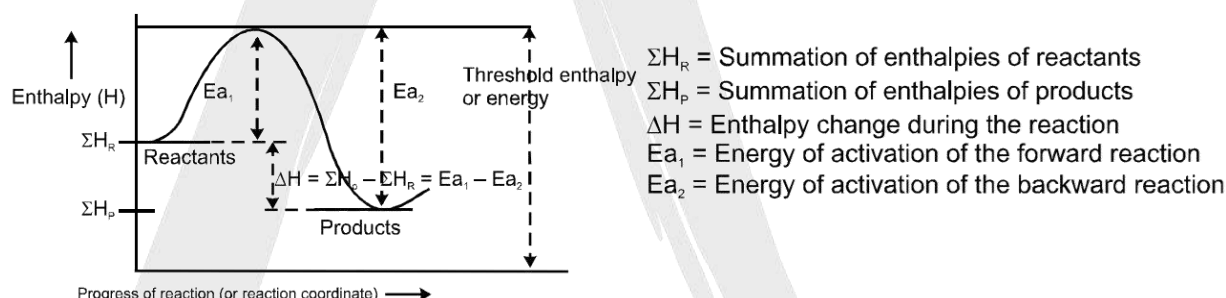

Passive molecules \rightleftharpoons Active molecules, $\Delta H = +ve$

Concept of energy of activation (E_a)

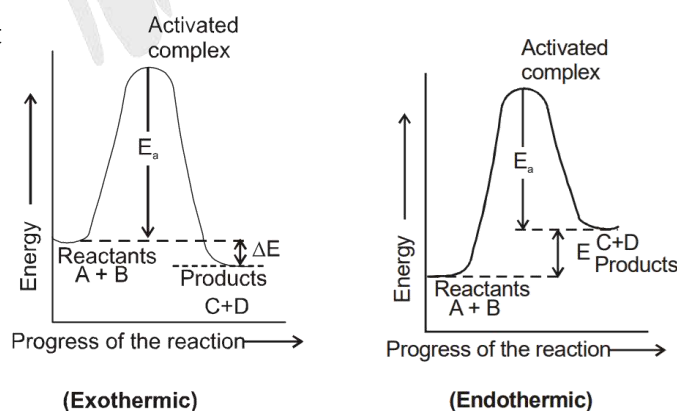

The extra amount of energy which the reactant molecules (having energy less than the threshold) must acquire so that their mutual collision may lead to the breaking of bond(s) and hence the energy is known as energy of activation of the reaction. It is denoted by the symbol E_a . Thus,

$E_a = \text{Threshold energy} - \text{Actual average energy}$

The essence of Arrhenius Theory of reaction rate is that there exists an energy barrier in the reaction path between reactant(s) and product(s) and for reaction to occur the reactant molecules must climb over the top of the barrier which they do by collision. The existence of energy barrier and concept of E_a can be understood from the following diagram.

From the figure above it can be concluded that the minimum activation energy of any exothermic reaction will be zero while minimum activation energy for any endothermic reaction will be equal to ΔH . Greater the height of energy barrier, greater will be the energy of activation and more slower will be the reaction at a given temperature.

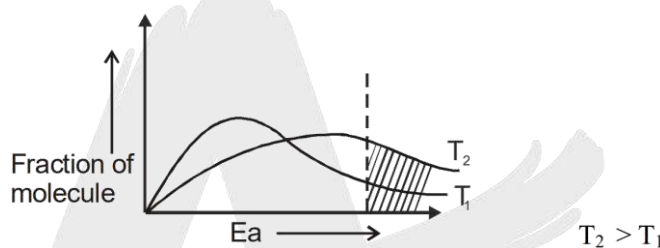

Rate of any chemical reaction = Collision frequency \times fraction of the total number of effective collision

Collision frequency \times fraction of the total number of collision in which K.E. of the colliding molecules equals to E_a or exceeds over it.

Collision frequency is the number of collisions per unit volume per unit time. It is denoted by the symbol Z . Z is directly proportional to \sqrt{T} . By 10°C rise in temperature, so it is the fraction of the total number of effective collision that increases markedly resulting into marked increase in the reaction rate.

From maxwellian distribution it is found that fraction of molecules having excess energy greater than threshold energy lead to the formation of product.

$e^{-E_a/RT}$ represents fraction of molecules. having energy greater E_a

rate $\propto e^{-E_a/RT}$

dependence of rate on temperature is due to dependence of k on temperature.

$k \propto e^{-E_a/RT}$

$k = Ae^{-E_a/RT}$ [Arrhenius equation]

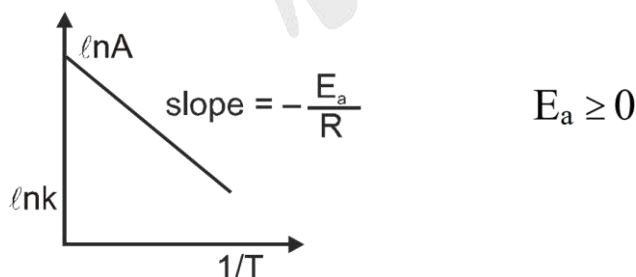

A is pre exponential factor / frequency factor representing collisions taking place with proper orientation.

A and E_a are independent of temperature generally.

$E_a = \text{min K. E. that colliding molecules must have to reach transition state.}$

$$\ln k = \ln A - \frac{E_a}{RT}$$

As $T \rightarrow \infty$, $k \propto A$

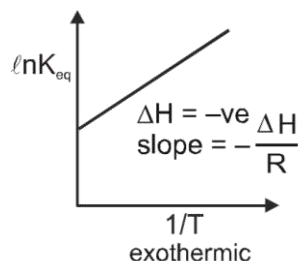

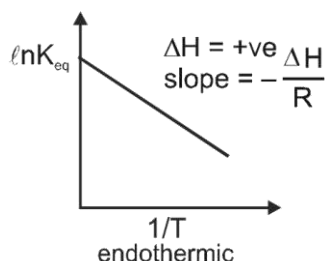

9.1 REVERSIBLE REACTIONS

$$k_f = A_f e^{-E_{af}/RT}$$

$$k_b = A_b e^{-E_{ab}/RT}$$

$$K_{eq} = \frac{k_f}{k_b} = \frac{A_f e^{-E_{af}/RT}}{A_b e^{-E_{ab}/RT}} = \left(\frac{A_f}{A_b}\right) e^{-(E_{af}-E_{ab})/RT}$$

$$\ln K_{eq} = -\frac{\Delta H}{RT} + \ln \left(\frac{A_f}{A_b}\right)$$

At temperature T_1 , rate constant = k_1

At temperature T_2 , rate constant = k_2

$$\ln k_1 = \ln A - \frac{E_a}{RT_1} \Rightarrow \ln k_2 = \ln A - \frac{E_a}{RT_2} \Rightarrow \ln \frac{k_2}{k_1} = \frac{E_a}{R} \left\{ \frac{1}{T_1} - \frac{1}{T_2} \right\} \text{ (remember)}$$

Ex.32 Two 1st order reactions are initially having equal rate at a particular temperature. Temperature of both the reaction is increased by same amount. Calculate rate of which reaction will increase by greater amount (reaction with low E_a or high E_a)

Sol. $\ln \left(\frac{k_2}{k_1}\right) = \frac{E_a}{R} \left\{ \frac{1}{T_1} - \frac{1}{T_2} \right\}$

$$\ln \left(\frac{k'_2}{k'_1}\right) = \frac{E'_a}{R} \left[\frac{1}{T_1} - \frac{1}{T_2} \right]$$

Equation (i) - (ii).

$$\ln \left(\frac{k_2}{k'_2}\right) = \frac{\Delta T}{R} (E_a - E'_a)$$

$$\text{if } E_a > E'_a, \quad k_2 > k'_2,$$

$$\text{or } k = A e^{-E_a/RT}$$

$$\text{or } \frac{dk}{dT} = \frac{-E_a}{R} \left(\frac{-1}{T^2}\right) A e^{-E_a/RT}$$

$$\text{temperature coeff. of rate constant } \frac{1}{k} \frac{dk}{dT} = \frac{E_a}{RT^2} \text{ or } \frac{\Delta k}{k \cdot \Delta T} = \text{fractional change / unit temp. rise}$$

Ex.33 Explain on the basis of temperature coeff. of rate const. that equilibrium of endothermic reaction shifts in forward direction on increasing temperature while equilibria of exothermic shift

back. $\ln \left(\frac{K_{eq1}}{K_{eq2}}\right) = \frac{\Delta H}{R} \left\{ \frac{1}{T_1} - \frac{1}{T_2} \right\}$

Sol. $\Delta H = E_{af} - E_{ab} > 0$ (for endothermic)

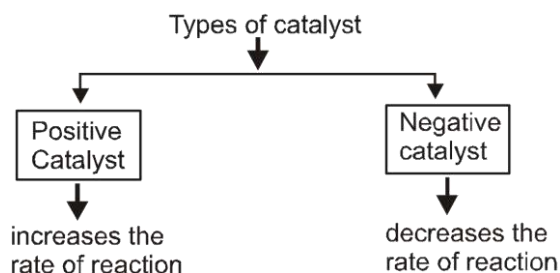

$$E_{af} > E_{ab}$$

on increasing temp. $k_f \uparrow$ more than k_b

equilibrium will shift in forward direction.

10. Catalyst and catalysis:

A catalyst is a substance, which increases the rate of a reaction without itself being consumed at the end of the reaction, and the phenomenon is called catalysis.

Catalyst are generally foreign substances but sometimes one of the product may act as a catalyst and such catalyst is called "auto catalyst" and the phenomena is called auto catalysis.

Examples of catalysis

(a) Thermal decomposition of KClO_3 is found to be accelerated by the presence of MnO_2 . Here MnO_2 acts as a catalysts.

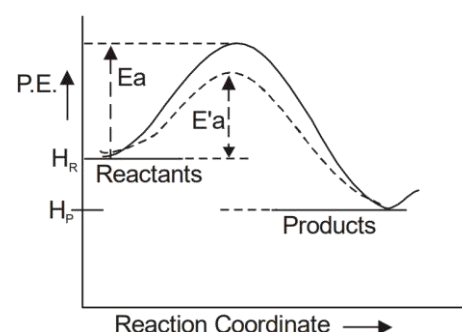

- MnO_2 can be received in the same composition and mass at the end of the reaction.

(b) In the permanganate titration of oxalic acid initially there is slow discharge of the colour of permanganate solution but afterwards the discharge of the colour become faster. This is due to the formation of MnSO_4 during the reaction which acts as a catalyst for the same reaction. Thus, MnSO_4 is an "auto catalyst" for this reaction. This is an example of auto catalyst.

**10.1 General characteristics of catalyst :**

- A catalyst does not initiate the reaction. It simply fastens it.
- Only a small amount of catalyst can catalyse the reaction.
- A catalyst does not alter the position of equilibrium i.e. magnitude of equilibrium constant and hence ΔG° . It simply lowers the time needed to attain equilibrium. This means if a reversible reaction in absence of catalyst completes to go to the extent of 75% till attainment of equilibrium, and this state of equilibrium is attained in 20 minutes then in presence of a catalyst the reaction will go to 75% of completion before the attainment of equilibrium but the time needed for this will be less than 20 minutes. A catalyst drives the reaction through a low energy path and hence E_a is less. That is, the function of the catalyst is to lower

down the activation energy.

E_a = Energy of activation in absence of catalyst.

E'_a = Energy of activation in presence of catalyst.

$E_a - E'_a$ = lowering of activation energy by catalyst.

10.2 Comparison of rates of reaction in presence and absence of catalyst:

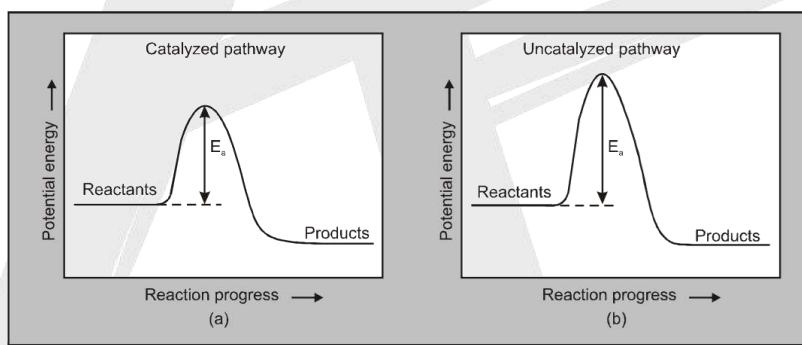

If k and k_{cat} be the rate constant of a reaction at a given temperature T , E_a and E'_a are the activation energies of the reaction in absence and presence of catalyst, respectively, the

$$\frac{k_{cat}}{k} = \frac{Ae^{-E'/RT}}{Ae^{-E_a/RT}} = e^{(E_a - E'_a)/RT}$$

Since $E_a - E'_a$ is positive so $k_{cat} > k$. the ratio $\frac{k_{cat}}{k}$ gives the number of times the rate of reaction will increase by the use of catalyst at a given temperature.

The rate of reaction in the presence of catalyst at any temperature T_1 may be made equal to the rate of reaction in absence of catalyst but for this sake we will have to raise the temperature.

Let this temperature be T_2 , $e^{-E'_a/RT_1} = e^{-E_a/RT_2}$ or $\frac{E'_a}{T_1} = \frac{E_a}{T_2}$

Ex.34 For the reaction $\text{CO(g)} + \text{Cl}_2(\text{g}) \rightarrow \text{COCl}_2(\text{g})$ under the same concentration conditions of the reactants, the rate of the reaction at 250°C is 1500 times as fast as the same reaction at 150°C . Calculate the activation energy of the reaction. If the frequency factor is $2.0 \times 10^{10} \text{M}^{-1} \text{sec}^{-1}$, calculate the rate constant of the reaction at 150°C .

Sol. $\log \frac{k_2}{k_1} = \frac{E}{2.303R} \left[\frac{T_2 - T_1}{T_1 T_2} \right]$

$$\log 1500 = \frac{E}{2.303 \times 2} \times \frac{100}{523 \times 423}$$

$$E = \frac{3.1761 \times 2.303 \times 2 \times 523 \times 423}{100} = 32.36 \text{ kcal mol}^{-1}$$

$$\log k = \log A - \frac{E}{2.303RT} = \log (2.0 \times 10^{10}) - \frac{32360}{2.303 \times 2 \times 423} = 10.301 - 16.609 = -6.308$$

$$k = 4.92 \times 10^{-7} \text{ litres mol}^{-1} \text{sec}^{-1}$$

Ex.35 The reaction $\text{A} + \text{B} \rightarrow \text{products}$

Calculate the initial rate of the reaction at 47°C when equal volumes of A and B of concentration 0.01 moles litre⁻¹ in each are mixed. The activation energy of the energy of the reaction is 42 kJ mol⁻¹.

Sol. Reaction $A + B \rightarrow \text{Product}$

$$\text{We know } \log \left(\frac{K_2}{K_1} \right) = \frac{\Delta E}{2.303R} \left[\frac{1}{T_1} - \frac{1}{T_2} \right]$$

$$\log \left(\frac{K_2}{K_1} \right) = \frac{\Delta E}{2.303R} \left[\frac{T_2 - T_1}{T_1 T_2} \right]$$

$$\log \left(\frac{K_2}{6} \right) = \frac{42 \times 10^3 [320 - 300]}{2.303 \times 8.3 \times 300 \times 320} = \frac{840}{1835.03}$$

$$\log \frac{K_2}{6} = .4577$$

$$\frac{K_2}{6} = \text{anti log } (.4577)$$

$$K_2 = 2.863 \times 6 = 17.178$$

Rate at 47°C will be

$$\text{The Rate}_2 = 17.178 \times [0.01] \times [0.01]$$

$$\text{Rate}_2 = 17.178 \times 10^{-4} = 1.7178 \times 10^{-3}$$

Ex.36 An exothermic reaction $A \rightarrow B$ has an activation energy of 17KJ per mole of A. The heat of reaction is -40KJ/mole. The activation energy for the reverse reaction $B \rightarrow A$ is :

(A) 75KJ per mole (B) 67KJ per mole (C) 57KJ per mole (D) 17KJ per mole

Sol. (C) $\Delta H = E_A - E_B$

$$-40 = 17 - E_B$$

$$E_B = 57$$

Ex.37 The rate of decomposition for methyl nitrite and ethyl nitrite can be given in terms of rate constant (in sec⁻¹) K_1 and K_2 respectively. The energy of activations for the two reactions are 152.30 kJ mol⁻¹ and 157.7 kJ mol⁻¹ as well as frequency factors are 10^{13} and 10^{14} respectively for the decomposition of methyl and ethyl nitrite. Calculate the temperature at which rate constant will be same for the two reactions.

Sol. Rate constant will be same.

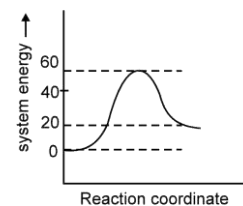

$$K_1 = K_2$$

$$A_1 e^{\frac{-E_{a1}}{RT}} = A_2 e^{\frac{-E_{a2}}{RT}}$$

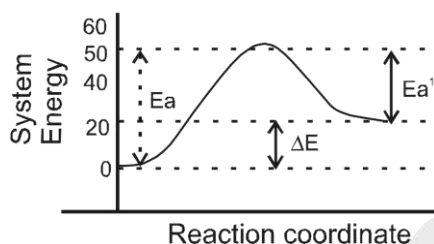

$$T = \frac{E_{a2} - E_{a1}}{2.303 \log \left(\frac{A_2}{A_1} \right) \times R} \Rightarrow T = \frac{157.7 - 152.3}{2.303 \times 8 \times \log \left(\frac{10^4}{10^3} \right)} \Rightarrow T = 282 \text{ K}$$

Ex.38 Use the diagram below to answer the following questions.

- Is the reaction exothermic or endothermic?
- What is the approximate value of ΔE for the forward reaction?
- What is activation energy in each direction?
- A catalyst is found that lowers the activation energy of the reaction by about 10 kJ/mol. How will this catalyst affect the rate of the reverse reaction?

Sol.

- Forward Rxn are endothermic
- $\Delta E = (E_a - E_{a'}) = (50 - 30) = 20 \text{ kJ/mol}$
- $E_{af} = 50 \text{ kJ/mol}$, $E_{ab} = 30 \text{ kJ/mol}$
- Increases

Ex.39 The rate of a first order reaction is 0.05 mole/L/s at 10 minutes and 0.04 mole/L/s at 30 minutes after initiation. Find the half-life of the reaction

Sol. Let the concentrations of the reactant after 10 min and 30 min be C_1 and C_2 respectively.

Rate after 10 min = $KC_1 = 0.05 \times 60$ and Rate after 30 min = $KC_2 = 0.04 \times 60$

$$\therefore \frac{C_1}{C_2} = \frac{5}{4}$$

Supposing the reaction starting after 10 minutes

$$k = \frac{2.303}{20} \log \frac{C_1}{C_2} = \frac{2.303}{20} \log \frac{5}{4} = 0.011159$$

$$\therefore t_{1/2} = \frac{0.6932}{k} = \frac{0.6932}{0.011159} = 62.12 \text{ min.}$$

Ex.40 For a chemical reaction $A + B \rightarrow \text{Product}$, the order is 1 with respect to each of A and B Find x and y from the given data.

Rate (moles/L/s)	[A]	[B]
0.10	0.1M	0.1M
0.80	x M	0.1M
0.40	0.2M	y M

Sol. The rate law may be written as

$$\text{rate} = k[A][B]$$

Substituting the first set of data in the rate law, we get,

$$0.10 = k \times 0.1 \times 0.1$$

$$k = 10$$

Now substituting the second and third sets of data, we get,

$$0.8 = 10 \times x \times 0.1$$

$$x = 0.80M$$

$$\text{and, } 0.4 = 10 \times 0.2 \times y$$

$$y = 0.20M$$

Ex.41 In the decomposition of H_2O_2 at 300 K, the energy of activation was found to be 16kcal/mole, while it decreased to 10kcal/ mole when the decomposition was carried out in the presence of a catalyst at 300 K, How many times is the catalysed reaction faster than the uncatalysed one?

Sol. Suppose E_1 and E_2 are the energies of activation when the reaction is carried out in the absence and presence of a catalyst respectively.

$$\text{Thus, } k_1 = Ae^{-E_1/RT}, k_2 = Ae^{-E_2/RT}$$

$$\text{Taking log, } \ln k_1 = \ln A - \frac{E_1}{RT}$$

$$\ln k_2 = \ln A - \frac{E_2}{RT}$$

$$\therefore \ln k_2 - \ln k_1 = -\frac{E_2}{RT} + \frac{E_1}{RT} \text{ or } \ln \frac{k_2}{k_1} = \frac{1}{0.002 \times 300} (16 - 10) = \frac{6}{0.002 \times 300}$$

$$2.303 \log \frac{k_2}{k_1} = 10$$

$$\log \frac{k_2}{k_1} = \frac{10}{2.303} = 4.342 +$$

$$\text{Taking antilog } \frac{k_2}{k_1} = 2.190 \times 10^4$$

Ex.42 In Arrhenius's equation for a certain Reaction, the value of A and E (activation energy) are $6 \times 10^{13} s^{-1}$ and $98.6 kJ mol^{-1}$ respectively. If the reaction is of first order, at what temperature will its half-life period be 20 minutes ?

Sol. $k = Ae^{-E/RT}$

$$\ln k = \ln A - \frac{E}{RT}$$

$$2.303 \log k = 2.303 \log A - \frac{E}{RT} \text{ or } \log k = \log A - \frac{E}{2.303RT}$$

Given that

$$A = 6 \times 10^{13} s^{-1}, E = 98.6 kJ mol^{-1}$$

$$t_{1/2} = 20 \times 60 s.$$

For first-order reaction $k = \frac{0.6932}{t_{1/2}} = \frac{0.6932}{1200} \text{ s}^{-1}$

Thus (1) becomes,

$$\log \frac{0.6932}{1200} = \log (6 \times 10^{13}) - \frac{98.6}{2.303 \times 8.314 \times 10^{-3} \times T} [R = 8.314 \times 10^{-3} \text{ kJ/K/mol}]$$

$$T = 302.26 \text{ K.}$$

Ex.43 The complexation of Fe^{2+} with the chelating agent dipyridyl has been studied kinetically in both forward and reverse directions.

$$\text{Rate (forward)} = (1.80 \times 10^{13})[\text{Fe}^{2+}][\text{dipy}]^3$$

$$\text{and rate (reverse)} = (1.20 \times 10^{-4})[\text{Fe}(\text{dipy})_3^{2+}]$$

Find the stability constant for the complex.

Sol. At dynamic equilibrium, rate of formation of complex = rate of its decomposition

$$(1.8 \times 10^{13})[\text{Fe}^{2+}][\text{dipy}]^3 = (1.20 \times 10^{-4})[\text{Fe}(\text{dipy})_3^{2+}]$$

$$K_s = \frac{[\text{Fe}(\text{dipy})_3^{2+}]}{[\text{Fe}^{2+}][\text{dipy}]^3} = \frac{1.8 \times 10^{13}}{1.2 \times 10^{-4}} = 1.5 \times 10^{17}$$

Ex.44 The approach to the following equilibrium was observed kinetically from both directions.

$$-\frac{d[\text{PtCl}_4]^{2-}}{dt} = (4.8 \times 10^{-5})[\text{PtCl}_4]^{2-} - (2.4 \times 10^{-3})[\text{Pt}(\text{H}_2\text{O})\text{Cl}_3^-][\text{Cl}^-]$$

Calculate the equilibrium constant for the complexation of Cl^- with Pt(II) .

Sol. At equilibrium, $\frac{d[\text{PtCl}_4]^{2-}}{dt} = 0$

$$\text{Hence, } 4.8 \times 10^{-5}[\text{PtCl}_4^{2-}] = 2.4 \times 10^{-3}[\text{Pt}(\text{H}_2\text{O})\text{Cl}_3^-][\text{Cl}^-]$$

$$\text{or } K = \frac{[\text{PtCl}_4]^{2-}}{[\text{Pt}(\text{H}_2\text{O})\text{Cl}_3^-][\text{Cl}^-]} = \frac{2.4 \times 10^{-3}}{4.8 \times 10^{-5}} = 50.$$

Ex.45 Some $\text{PH}_3(\text{g})$ is introduced into a flask at 600°C containing an inert gas PH_3 proceeds to decompose into $\text{P}_4(\text{g})$ and $\text{H}_2(\text{g})$ and the reaction goes to completion. The total pressure is given below as a function of time. Find the order of the reaction and calculate the rate constant for the reaction:

Time(s):	0	60	120	X
P mm(Hg)	262.40	272.90	275.51	276.40

Sol. Let the initial Partial pressures of PH_3 and the inert gas be p and p' mm respectively and p' mm of PH_3 decomposes at different time intervals.

Initial partial pressure.

p

Partial pressure at different times:

$$p - p' \quad p'/4$$

$$6p'/4$$

As given, at $t = 0$ seconds.

$$p' + p' = 262.40$$

and, $t = 60$ second

$$p - p' + \frac{p'}{4} + \frac{6p'}{4} + p' = 272.90$$

$$\text{At } t = \infty: \frac{p}{4} + \frac{6p}{4} + p' = 276.40.$$

Solving, equations (1), (2) and (3), we get,

$$p = 18.67 \text{ and } p' = 14$$

Similarly, at $t = 120$ seconds

$$p - p' + \frac{p'}{4} + \frac{6p'}{4} + p' = 275.51$$

Solving, equations (1), (4) and (3), we get

$$p = 18.67 \text{ and } p' = 17.48.$$

As the given reaction is of the type $n\text{A} \rightarrow \text{products}$, where $n = 4$, we have the following equation for first-order kinetics

$$k_1 = \frac{2.303}{4t} \log \frac{a}{a-x} = \frac{2.303}{4t} \log \frac{p}{p-p'}.$$

$$\text{Thus, at } t = 60 \text{ s; } k_1 = \frac{2.303}{4 \times 60} \log \frac{18.67}{18.67-14} = 5.8 \times 10^{-3} \text{ s}^{-1}$$

$$t = 120 \text{ s; } k_1 = \frac{2.303}{4 \times 120} \log \frac{18.67}{18.67-17.48} = 5.8 \times 10^{-3} \text{ s}^{-1}$$

As the values of k_1 are constant, the given reaction following the first order kinetics.

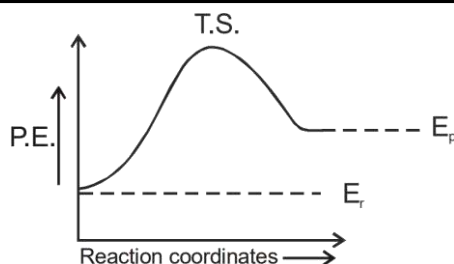

11. Mechanism of a reaction:

Reactions can be divided into

- Elementary / simple / single step
- Complex / multi-step

11.1 ELEMENTARY REACTION:

These reaction take place in single step without formation of any intermediate

For elementary reaction we can define molecularity of the reaction which is equal to no of molecules which make transition state or activated complex because of collisions in proper orientation and with sufficient energy

molecularity will always be a natural number.

1 = unimolecular one molecule gets excited (like radioactivity)

2 = bimolecular

3 = trimolecular

Molecularly 3 because the probability of simultaneous collision between 4 or more molecules in proper orientation is very low

For elementary reaction there is only single step and hence it is going to be rate determining step so order of an elementary reaction is its molecularity

Order of elementary reaction w.r.t. reactant = stoichiometric co-efficient of the reactant

$\text{H}_2 + \text{I}_2 \rightleftharpoons 2\text{HI}$ (Simple reaction)

$$\text{rate} = k[\text{H}_2][\text{I}_2]$$

$2\text{H}_2 + 2\text{I}_2 \rightleftharpoons 4\text{HI}$ (not elementary)

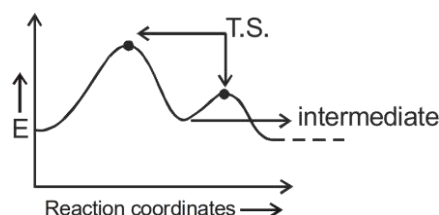

reaction obtained by multiplying an elementary reaction with some number will not be of elementary nature

order = 0

11.2 COMPLEX REACTION:

- Reaction which proceed in more than two steps. or having some mechanism. (sequence of elementary reaction in which any complex reaction proceeds)

- For complex reaction each step of mechanism will be having its own molecularity but molecularity of net complex reaction will not be defined.
- Order of complex reaction can be zero fractions whole no, even negative w.r.t. some species. Order of reaction or rate law of reaction is calculated with the help of mechanism of the reaction generally using Rate determine step (R.D.S) if given.
- Rate law of a reaction is always written in terms of conc. of reactant, products or catalysts but never in terms of conc. of intermediates.

The mechanism of any complex reaction is always written in terms of elementary steps, so molecularity of each of these steps will be defined but net molecularity of complex reaction has no meaning.

The mechanism of most of the reaction will be calculated or predicted by using mainly the following approximations.

12. CALCULATION OF RATE LAW/ ORDER

12.1 MECHANISM IN WHICH R.D.S. GIVEN

12.1.1 If R.D.S. involves only reactant, product or catalyst on reactant side rate law of

R.D.S. = rate law of reaction

Ex.46 Calculate order and rate law of reaction

with help of mechanism

(slow)

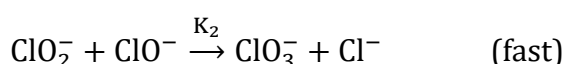

(fast)

molecularity = 2 for both

Sol. According to RDS

$$\text{Rate} = k_1[\text{NO}_2][\text{F}_2]$$

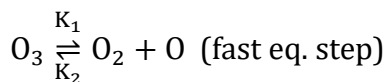

Ex.47 Calculate rate law

Sol. $\text{Rate} = k_1[\text{ClO}^-]^2$

12.1.2 RDS is having intermediate on reactant side

To calculate order, we have to specify [intermediate] in expression of rate law in terms of conc. of [R], [P] or catalyst with the help of some equilibrium step given in mechanism.

Ex.48 $2\text{O}_3 \rightarrow 3\text{O}_2$ 

(intermediate)

From R.D.S., rate = $k_3[\text{O}_3][\text{O}]$

According to equilibrium step.

$$K_{\text{eq.}} = \frac{k_1}{k_2} = \frac{[\text{O}_2][\text{O}]}{[\text{O}_3]}$$

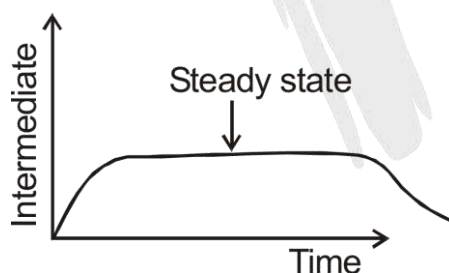

$$[\text{O}] = \left[\frac{k_1[\text{O}_3]}{k_2[\text{O}_2]} \right]$$

$$\text{Rate} = k_3[\text{O}_3][\text{O}] = k_3[\text{O}_3] \left[\frac{k_1[\text{O}_3]}{k_2[\text{O}_2]} \right]$$

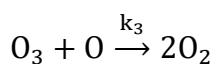

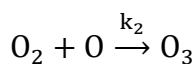

$$\text{Rate} = \frac{k_1 k_3}{k_2} \frac{[\text{O}_3]^2}{[\text{O}_2]}$$

12.2 MECHANISMS IN WHICH RDS NOT SPECIFIED**STEADY STATE APPROXIMATION**

Initially, for most of the cases only reactants are taken and hence the rate of production of intermediate is large in comparison to its rate of consumption but after some time rate of consumption of intermediate will become equal to its rate of production. This is known as steady state of reaction. Finally when reaction is going to get completed, rate of consumption will become more than rate of production. But for most of the times reaction remains at steady state. So rate law of reaction during steady state can be taken to be final or net rate law of reaction.

$$\text{At steady state } \frac{d[\text{intermediate}]}{dt} = 0$$

Ex-49 $2\text{O}_3 \rightarrow 3\text{O}_2$ 

Sol. $\text{rate} = -\frac{1}{2} \frac{d[\text{O}_3]}{dt} = \frac{1}{3} \frac{d[\text{O}_2]}{dt}$

$$\frac{d[\text{O}_3]}{dt} = -k_1[\text{O}_3] + k_2[\text{O}_2][\text{O}] - k_3[\text{O}_3][\text{O}]$$

$$\frac{d[\text{O}_2]}{dt} = k_1[\text{O}_3] - k_2[\text{O}_2][\text{O}] + 2k_3[\text{O}_3][\text{O}]$$

At steady state $\frac{d[\text{O}]}{dt} = 0$

$$\frac{d[\text{O}]}{dt} = k_1[\text{O}_3] - k_2[\text{O}_2][\text{O}] - k_3[\text{O}_3][\text{O}] = 0$$

$$[\text{O}] = \frac{k_1[\text{O}_3]}{k_2[\text{O}_2] + k_3[\text{O}_3]}$$

$$\frac{d[\text{O}_3]}{dt} = -k_1[\text{O}_3] + \frac{\{k_2[\text{O}_2]k_1[\text{O}_3]\}}{k_2[\text{O}_2] + k_3[\text{O}_3]} - \frac{k_1k_3[\text{O}_3]^2}{k_2[\text{O}_2] + k_3[\text{O}_3]}$$

$$= -k_1[\text{O}_3] + \frac{k_1k_2[\text{O}_2][\text{O}_3] - k_1k_3[\text{O}_3]^2}{k_2[\text{O}_2] + k_3[\text{O}_3]}$$

$$= \frac{-k_1k_2[\text{O}_2][\text{O}_3] - k_1k_3[\text{O}_3]^2 + k_1k_2[\text{O}_2][\text{O}_3] - k_1k_3[\text{O}_3]^2}{k_2[\text{O}_2] + k_3[\text{O}_3]} = \frac{-2k_1k_3[\text{O}_3]^2}{k_2[\text{O}_2] + k_3[\text{O}_3]}$$

$$\left[-\frac{1}{2} \frac{d}{dt} [\text{O}_3] \right] = \frac{k_1k_3[\text{O}_3]^2}{k_2[\text{O}_2] + k_3[\text{O}_3]}$$

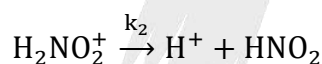

$$\text{Rate} = -\frac{1}{2} \frac{d}{dt} [\text{O}_3]$$

$$\text{So, Rate (r)} = \frac{k_1k_3[\text{O}_3]^2}{k_2[\text{O}_2] + k_3[\text{O}_3]}$$

if 3rd step is RDS then $k_1 \gg k_3$

$$k_2 \gg k_3$$

$$r = \frac{k_1k_3[\text{O}_3]^2}{k_2[\text{O}_2]}$$

Sol. $\frac{d[\text{H}_2\text{NO}_2^+]}{dt} = k_1[\text{H}^+][\text{HNO}_2] - k_2[\text{H}_2\text{NO}_2^+] - k_3[\text{H}_2\text{NO}_2^+][\text{Br}^-] = 0$

$$[\text{H}_2\text{NO}_2^+] = k_1 \frac{[\text{H}^+][\text{HNO}_2]}{k_2 + k_3[\text{Br}^-]}$$

$$\text{rate} = \frac{d}{dt} [\text{C}_6\text{H}_5\text{NH}_2] = \frac{d}{dt} [\text{HNO}_2]$$

$$\frac{d}{dt} [\text{C}_6\text{H}_5\text{NH}_2] = k_4[\text{NOBr}^2][\text{C}_6\text{H}_5\text{NH}_2]$$

$$\frac{d}{dt} [\text{NOBr}^0] = -k_4[\text{C}_6\text{H}_5\text{NH}_2][\text{NOBr}^2] + k_3[\text{Br}^-][\text{H}_2\text{NO}_2^+] = 0$$

$$[\text{NOBr}] = \frac{k_3[\text{Br}^-][\text{H}_2\text{NO}_2^+]}{k_4[\text{C}_6\text{H}_5\text{NH}_2]}$$

$$r = \frac{k_4 k_3 [\text{Br}^-][\text{H}_2\text{NO}_2^+]}{k_4 [\text{C}_6\text{H}_5\text{NH}_2]}$$

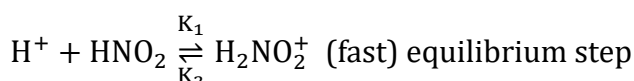

$$r = \frac{k_1 k_3 [\text{Br}^-][\text{H}^+][\text{HNO}_2]}{k_2 + k_3 [\text{Br}^-]}$$

DO YOURSELF-4

- Temperature coefficient of the rate of a reaction is 3. How many times the rate of reaction would increase if temperature is raised by 30 K :
(A) 3 (B) 9 (C) 27 (D) 81
- On introducing a catalyst at 500 K, the rate of a first order increase to 1.718 times. The activation energy in the presence of a catalyst is 6.05 KJ/mole. The slope of the plot of $\ln k$ (sec^{-1}) against $1/T$ in the absence of catalyst is.
- The pyrolysis of an organic ester follows a first order process and its rate constant can be expressed as
 $\ln k = 78.09 - \frac{42075}{T}$ where k is given in the min^{-1} .
Calculate the time required for 25 percent reaction to complete at 227°C .
- The slope of the plot of $\log k$ vs $\frac{1}{T}$ for a certain reaction was found to be -5.4×10^3 . Calculate the energy of activation of the reaction. If the rate constant of the reaction is $1.155 \times 10^{-2} \text{sec}^{-1}$ at 373 K, what is its frequency factor?
- The decomposition of N_2O_5 according to the equation, $2 \text{N}_2\text{O}_5(\text{g}) \rightarrow 4 \text{NO}_2(\text{g}) + \text{O}_2(\text{g})$ is a first-order reaction. After 30 minutes from the start of the decomposition in a closed vessel, the total pressure developed is found to be 284.5 mm of Hg and on complete decomposition the total pressure is 584.5 mm of Hg. Calculate the rate constant of the reaction.
- Express rate law for the following reaction?

Intermediate

intermediate

DO YOURSELF-1

1. (C)

Sol. $A(g) + 2 B(g) \rightarrow C(g)$

$$t = 0 \quad 0.4 \text{ atm} \quad 1 \text{ atm} \quad 0 \text{ atm}$$

$$t = t \quad (0.4 - 0.3) \text{ atm} \quad (1 - 0.6) \text{ atm} \quad 0.3 \text{ atm}$$

Since reaction is elementary.

So, Rate of reaction w.r.t. A & B will be of order equal to stoichiometric coefficient

$$\text{Rate} = K[A][B]^2$$

$$\text{Rate}_{(\text{Initial})} = K[0.4][1]^2$$

$$\text{Rate}_{(\text{after } t)} = K[0.1][0.4]^2$$

$$\frac{R_{(t=t)}}{R_{(t=0)}} = \frac{K[0.1][0.4]^2}{K[0.4][1]} = \frac{1}{25}$$

2. (B)

Sol. Rate constant change on changing temperature.

3. (D)

4. Which of the following relation is correct for k_f and k_b in an equilibrium process that contains equal moles of reactants and products.(A) $k_f = k_b$ (B) $k_f > k_b$ (C) $k_f < k_b$ (D) we cannot predict

Ans. (D)

Sol. $K_{eq} = \frac{k_f}{k_b} = \frac{\text{Conc. of products as per rate law}}{\text{Conc. of reactants as per rate law}}$ stoichiometry of reaction is required.

5. (A)

$$6. \text{ Average Rate} = \frac{1}{2} \left\{ -\frac{\Delta[N_2O_5]}{\Delta t} \right\} = -\frac{1}{2} \left\{ \frac{(2.08 - 2.33) \text{ mol L}^{-1}}{184 \text{ min}} \right\}$$

$$= 6.79 \times 10^{-4} \text{ mol L/min} = (6.79 \times 10^{-4} \text{ mol L}^{-1} \text{ min}^{-1}) \times (60 \text{ min/1 h})$$

$$= 4.07 \times 10^{-2} \text{ mol L L}^{-1}/\text{h}$$

$$= 6.79 \times 10^{-4} \text{ mol L}^{-1} \times 1 \text{ min/60 s}$$

$$= 1.13 \times 10^{-5} \text{ mol L}^{-1} \text{ s}^{-1}$$

It may be remembered that

$$\text{Rate} = \frac{1}{4} \left\{ \frac{\Delta[NO_2]}{\Delta t} \right\}$$

$$\frac{\Delta[NO_2]}{\Delta t} = 6.79 \times 10^{-4} \times 4 \text{ mol L min}^{-1} = 2.72 \times 10^{-3} \text{ mol L}^{-1} \text{ min}^{-1}$$

DO YOURSELF-2

$$1. \frac{t_{0.5}}{t_{0.25}} = \frac{\frac{2.303}{K} \log \frac{a}{(a-\frac{a}{2})}}{\frac{2.303}{K} \log \frac{a}{(a-\frac{a}{4})}} = \frac{\log 2}{(\log \frac{4}{3})} = 2.5$$

2. (B)

$$\text{Sol.} \quad \begin{array}{ccccccccc} 100 & \xrightarrow{t_{1/2}} & 50 & \xrightarrow{t_{1/2}} & 25 & \xrightarrow{t_{1/2}} & 12.5 & \xrightarrow{t_{1/2}} & 6.25 & \xrightarrow{t_{1/2}} & 3.125 \\ 0\% & & 50\% & & 75\% & & 87.5\% & & 93.75\% & & 96.875\% \end{array}$$

3. 1.73 time

$$\text{Sol.} \quad K = \frac{0.693}{75} = 0.00924$$

$$K = \frac{1}{t} \ln \frac{a+x}{a}$$

$$\frac{a+x}{a} = 1.73.$$

$$\text{Sol.} \quad \frac{C_{At}}{C_{A0}} = \left(\frac{1}{2}\right)^3 \text{ and } \frac{C_{Bt}}{C_{B0}} = \left(\frac{1}{2}\right)^2$$

$$\text{Or } \frac{C_{At}}{C_{Bt}} \times \frac{C_{B0}}{C_{A0}} = \frac{1}{2} \text{ or } \frac{C_{At}}{C_{Bt}} = \frac{1}{2} \times \frac{3}{2} = \frac{3}{4} = 0.75$$

5. (A)

$$\text{Sol.} \quad \text{By graph we can say } \log t_{1/2} = \log at_{1/2} = a$$

$$t_{1/2} \propto a \text{ then zero order Rxn}$$

$$k \times t_{1/2} = \frac{a}{2} \text{ then } k = \frac{1}{2}$$

6. (A)

$$\text{Sol.} \quad 2A + B \text{ product}$$

$$-\frac{d[A]}{dt} = K[A]$$

$$-\frac{d[A]}{dt} = K[a - x]$$

$$C_t = C_0 e^{-Kt}$$

$$C_t = C_0 e^{-K \times \frac{1}{K}}$$

$$C_t = C_0 e^{-1}$$

$$C_t = \frac{C_0}{e}$$

DO YOURSELF-3

1. (B)

Sol. we know $E_a = \frac{E_{a1} \times K_1 + E_{a2} \times K_2}{(K_1 + K_2)} = \frac{[1.0 \times 10^{-2} \times 60 + 3 \times 10^{-2} \times 70]}{[1.0 \times 10^{-2} + 3.0 \times 10^{-2}]}$

$$E_a = 67.5 \text{ kJ/mole}$$

2. (B)

Sol. Let $r = (A)^x(B)^y$

$$x = \frac{\log \left(\frac{r_1}{r_2} \right)}{\log \left(\frac{a_1}{a_2} \right)} = \frac{\log \frac{0.1}{0.1}}{\log \left(\frac{0.012}{0.024} \right)} = \frac{\log \left(\frac{1}{8} \right)}{\log \left(\frac{1}{2} \right)}$$

$$x = 3$$

$$y = \frac{\log \left(\frac{r_1}{r_3} \right)}{\log \left(\frac{b_1}{b_3} \right)} = \frac{\log \left(\frac{0.1}{0.1} \right)}{\log \left(\frac{0.035}{0.070} \right)} = \frac{\log (1)}{\log \left(\frac{1}{2} \right)}$$

$$y = 0$$

3. $\text{NH}_4\text{NO}_2(s) \rightarrow \text{N}_2(g) + 2\text{H}_2\text{O}(l)$

Let V_t be the volume of N_2 Collected at time 't' V_∞ = be the volume of N_2 Collected at the end of the Reaction $a \propto V_\infty$ $(a - x) \propto V_\infty - V_t$

Then from the given data We assume the Rxn is first order Then

$$K = \frac{2.303}{t} \log \frac{a}{(a - x)} = \frac{2.303}{t} \log \frac{V_\infty}{V_\infty - V_t}$$

13.1 PROPERTIES OF α , β -PARTICLES AND γ -RAYS.

	Properties	Alpha	beta	Gamma
1.	Nature	Fast moving He nuclei	Fast moving electrons	High energy
2.	Representation	${}_2\text{He}^4$ or α	${}_{-1}\text{e}^0$ or ${}_{-1}\beta^0$	γ or ${}_0^0\gamma$
3.	Charge	2 unit (+ve)	1 unit (-ve)	no charge
4.	Velocity	1/10 of light (light)	Same as light waves

6.	Travel distance in air	2 – 4 cm	200 – 300 cm	500 m
7.	Kinetic energy	high	low	-
8.	Effect on ZnS plate	Luminosity	Little effect	-
9.	Mass g/particle	6.65×10^{-24}	9.11×10^{-24}	-
10.	Relative ionising power	10000	100	1

13.2 Kinetics of nuclear disintegration

Radioactive decay is a first order process. Hence $-\frac{dN}{dt} = \lambda N$ or $N = N_0 e^{-\lambda t}$

where N = number of radioactive nuclei at any time t ;

N_0 = number of radioactive nuclei at $t = 0$;

λ = decay constant.

Activity (A) = $-\frac{dN}{dt} = \lambda N$

S.I. units :

Disintegration per second (symbol s^{-1} or dps). 1dps = 1 Bq (Becquerel)

Other units:

1Ci (Curie) = 3.7×10^{10} dps.

1Rd (Rutherford) = 10^6 dps

Specific activity = dps/gm

Half life ($t_{1/2}$) The time taken by half the nuclei (originally present) to decay. $t_{1/2} = 0.693/\lambda$

Note : After n half-lives have passed, activity is reduced to $\frac{1}{2^n}$ of its initial value.

Average life (t_{av})

$$T_{avg} = \frac{1}{\lambda} = \frac{t_{1/2}}{0.693} = 1.44t_{1/2}$$

$$\text{From II}^{\text{st}} \text{ data } K = \frac{2.303}{10} \log \frac{35.05}{(35.05 - 6.25)} = 1.96 \times 10^{-2} \text{sec}^{-1}$$

$$\text{II}^{\text{nd}} \text{ data } K = \frac{2.303}{15} \log \frac{35.05}{(35.05 - 9)} = 1.96 \times 10^{-2} \text{sec}^{-1}$$

$$\text{III}^{\text{rd}} \text{ data } K = \frac{2.303}{20} \log \frac{35.05}{(35.05 - 11.40)} = 1.96 \times 10^{-2} \text{sec}^{-1}$$

From these relation the value of K are same the reaction will be First order

4. If reaction first order the value of K same in First-Order Expression

$$K = \frac{2.303}{10} \log \frac{(r_0 - r_{\infty})}{r_t - r_{\infty}}$$

$$K = \frac{2.303}{10} \log \frac{32.4 + 11.1}{28.8 + 11.1} = \frac{0.03751 \times 2.303}{10} = 8.63 \times 10^{-3}$$

$$K = \frac{2.303}{20} \log \frac{32.4 + 11.1}{25.5 + 11.1} = 8.63 \times 10^{-3}$$

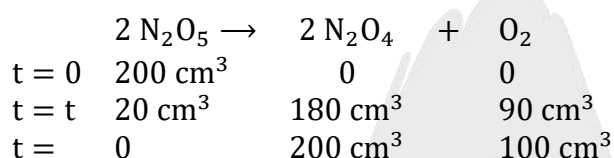

$$K = \frac{2.303}{30} \log \frac{32.4 + 11.1}{22.4 + 11.1} = 8.63 \times 10^{-3}$$

$$K = \frac{2.303}{40} \log \frac{32.4 + 11.1}{19.6 + 11.1} = 8.63 \times 10^{-3}$$

The reaction show 1st order kinetics

5. (A)

Sol. $kt = \ln \left(\frac{C_0}{C_t} \right)$

Initial volume of $\text{N}_2\text{O}_5 = 200 \text{ cm}^3$.

because Max. volume of $\text{O}_2 = 100 \text{ cm}^3$.

$$\therefore K \times 500 = \ln \left(\frac{200}{20} \right) \Rightarrow k = \frac{\ln 10}{500} = \frac{2.303}{500}$$

DO YOURSELF-4

1. (C) For same concentration $\frac{R_2}{R_1} = \frac{K_2}{K_1} = 3^{\frac{30}{10}} = 27$.

2. -1000

Sol. $1.718 = \text{Antilog} = \frac{E_a - E_p}{2.303 \times 8.314 \times 500}$

$$E_a - E_p = 2.25 \text{ KJ}$$

$$E_a = E_p + 2.25 = 6.05 + 2.25 = 8.30 \text{ KJ/mole}$$

$$\ln k = \ln A - \frac{E_a}{RT}$$

$$\text{Slope} = \frac{-E_a}{R} = \frac{-8.3 \times 1000}{8.3} = -1000$$

$$3. \ln k = 78.09 - \frac{42075}{500} = -6.06$$

$$\log k = -\frac{6.06}{2.303} = -2.63; k = 2.344 \times 10^{-3} \text{ min}^{-1}$$

$$\text{when } x = 0.25; k = \frac{2.303}{t_{1/4}} \log \frac{a}{0.75a}$$

$$t_{1/4} = \frac{2.303}{2.344 \times 10^{-3}} \log 1.333 = 123.06 \text{ min}$$

4. (a) $\text{slope} = \frac{-E}{2.303R} = -5.4 \times 10^3$
 $E = 5.4 \times 10^3 \times 2.303 \times 1.987 = 24.624 \text{ cal mol}^{-1}$
 (b) $K = Ae^{-E/RT}$; $\log 1.155 \times 10^{-2} = \log A - \frac{24.624}{2.303 \times 1.987 \times 373}$ or $A = 1.764 \times 10^3 \text{ sec}^{-1}$

5.

at $t = 0$ $2 \text{ N}_2\text{O}_5 \rightarrow 4 \text{ NO}_2 + \text{O}_2$
 After 30 min: $a - x \quad 2x \quad x/2$
 $\therefore (a - x) + 2x + \frac{x}{2} = 284.5$
 or $a + \frac{3x}{2} = 284.5$

After complete decomposition of N_2O_5 .

$2 \text{ N}_2\text{O}_5 \rightarrow 4 \text{ NO}_2 + \text{O}_2$
 $0 \quad 2a \quad a/2$
 $\therefore 2a + \frac{a}{2} = 584.5$
 or $\frac{5a}{2} = 584.5$

From (1) and (2), we get,

$a = 233.5, x = 34$

Thus, for a first-order reaction of the type $2 \text{ A} \rightarrow \text{products}$

$k = \frac{1}{2t} \log \frac{a}{a-x}$
 $k = \frac{2.303}{2 \times 30} \log \frac{233.5}{233.5 - 34} = 2.625 \times 10^{-3} \text{ min}^{-1}$

6. $r = k_3[\text{Br}][\text{H}_2\text{NO}_2^+]$

$K_{\text{eq}} = \frac{k_1}{k_2} = \frac{[\text{H}_2\text{NO}_2^+]}{[\text{H}^+][\text{HNO}_2]}$

$[\text{H}_2\text{NO}_2^+] = \left[\frac{k_1}{k_2} \right] [\text{H}^+][\text{HNO}_2]$

$r = \frac{k_1 k_3}{k_2} [\text{H}^+][\text{HNO}_2][\text{Br}].$
