

## DPP-02

## SOLUTION

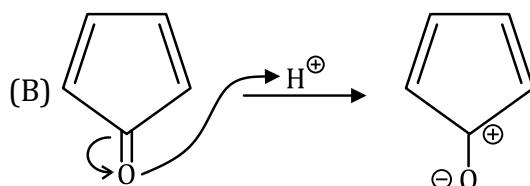

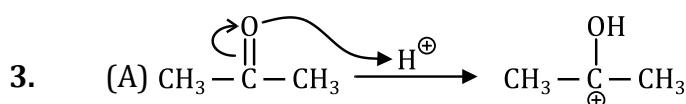

Link to View Video Solution:  [Click Here](#)

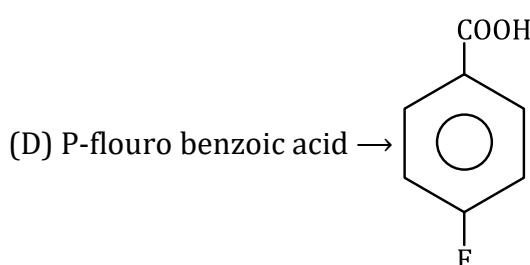

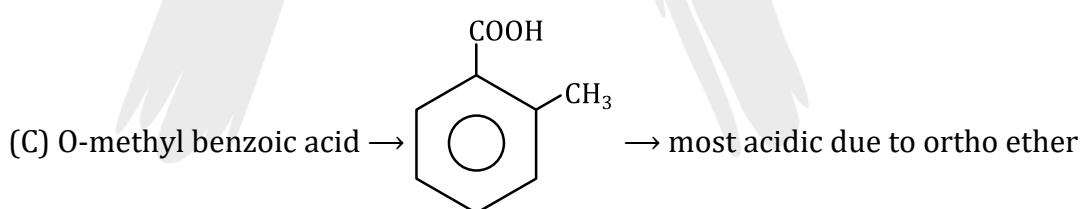

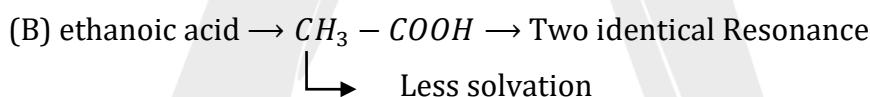

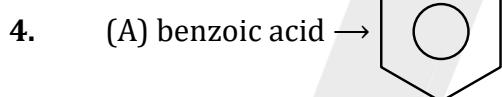

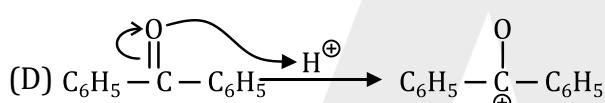

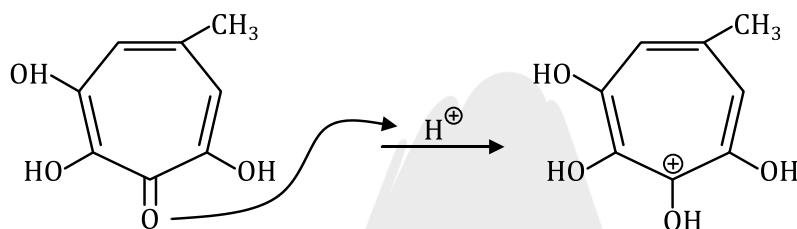

(P) > (S) > (Q) > (R)

- ⇒ The boiling point increases with increasing the capability of inter molecular hydrogen bond formation.
- ⇒ the boiling by the two M-nitrophenol & highest followed by the ortho-nitrophenol this is due to the intermolecular hydrogen bonding in P-nitrophenol which is absent in both meta & ortho.

(C) Aromatic most stable

Link to View Video Solution: [Click Here](#)

(C) > (D) > (A) > (B)

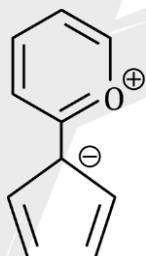

↓                    ↓                    ↓                    ↓

P  $K_a \Rightarrow 4.74$                     4.17                    4.14                    3.19

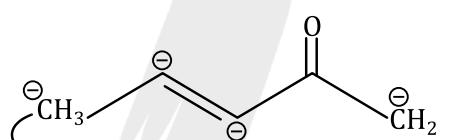

(R) > (P) > (Q) > (S)

5. Complete octet of oxygen atom.

Hence most stable (B)

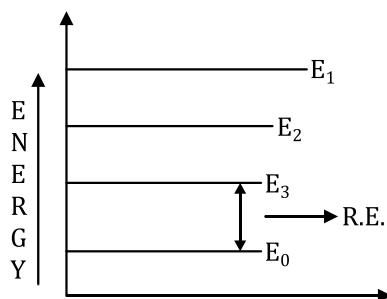

6.

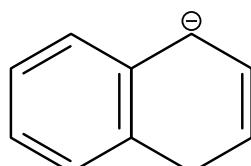

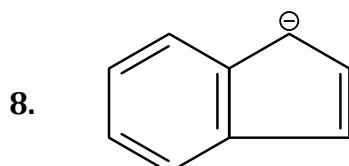

most stable carbanion due to maximum delocalization of carbanion (extended conjugation)

7. (C)  $E_3 - E_0$

Hence resonance energy (R.E.) will be  $E_3 - E_0$

⇒ Aromatic  
⇒ largest conjugation  
⇒ more acidic

⇒ less conjugation  
⇒ less stable conjugate base  
⇒ less acidic

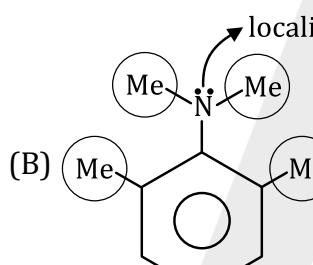

(I > II) (Because both ring are aromatic)

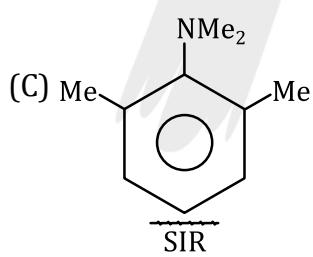

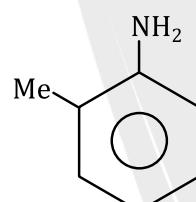

(-I)SIR affect

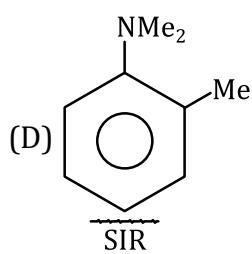

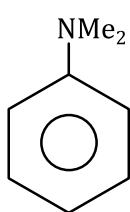

⇒ less solvation

SIR affect  
most basic

SIR

SIR

(A,C,D) Correct

10. HOH of cyclooctene = -23 kcal/mol<sup>-1</sup>

HOH of cyclooctatetraene = -98 kcal/mol<sup>-1</sup>
